THIS MANUAL WAS REVISED IN SEPTEMBER, 2002.
THE NEXT EDITION IS EXPECTED IN SEPTEMBER, 2003.
WARNING

IMPORTANT NOTICE

Sport parachuting or skydiving is a potentially dangerous activity that can result in injury or death. EACH INDIVIDUAL PARTICIPANT, REGARDLESS OF EXPERIENCE, HAS FINAL RESPONSIBILITY FOR HIS OR HER OWN SAFETY.

THE FOLLOWING INFORMATION IS PRESENTED AS A MEMBERSHIP SERVICE BY THE UNITED STATES PARACHUTE ASSOCIATION (USPA). USPA MAKES NO WARRANTIES OR REPRESENTATIONS AND ASSUMES NO LIABILITY CONCERNING THE VALIDITY OF ANY ADVICE, OPINION OR RECOMMENDATION EXPRESSED IN THIS MATERIAL. ALL INDIVIDUALS RELYING ON THIS MATERIAL DO SO AT THEIR OWN RISK.

An individual’s safety can be enhanced by exercising proper precautions and procedures. This manual contains some of the knowledge and practices that, in the opinion of USPA, will promote the safe enjoyment of skydiving.

The UNITED STATES PARACHUTE ASSOCIATION is a not-for-profit, voluntary membership organization of the participants and supporters of the sport of parachuting. The sport is also referred to as skydiving. USPA has no involvement in the conduct or operations of any skydiving center, parachute center, or drop zone. USPA, AS A PRIVATE, NON-REGULATORY ORGANIZATION WHICH HAS NO LEGAL AUTHORITY TO REGULATE OR CONTROL INDIVIDUALS OR CORPORATIONS, CANNOT BE HELD LIABLE FOR ANY JUMP OR TRAINING OPERATIONS THAT RESULT IN INJURY OR DEATH TO ANY PARTY. Regardless of any statements made in any USPA publications, USPA has neither been given nor has it assumed any duty to anyone. USPA has no obligation to anyone concerning his or her skydiving activities. All references by USPA to self-regulation refer to each individual person regulating or being responsible for him or herself.

USPA issues various licenses, ratings, awards, and appointments and provides various types of information, advice, and training but does not authorize anyone in any capacity to act for USPA as an agent or representative in connection with the regulation or control of skydiving operations.

It is the responsibility of each student to ask whatever questions are necessary for him or her to have a thorough understanding of the actions and procedures that he or she must perform in order to make a safe jump. Each skydiver has the responsibility to exercise certain practices and perform certain actions to maintain safety for himself or herself and for other people.

USPA MAKES NO WARRANTIES, EXPRESSED OR IMPLIED, AS TO THE INFORMATION SET FORTH IN THIS MANUAL. PEOPLE RELYING THEREON DO SO AT THEIR OWN RISK.
INTRODUCTION

A. PURPOSE AND SCOPE OF THE USPA SKYDIVER’S INFORMATION MANUAL

The Skydiver’s Information Manual (SIM) provides basic skydiving standards (the Basic Safety Requirements) and recommendations agreed upon by USPA members for the conduct of safe and enjoyable skydiving. It also describes the programs USPA administers to recognize individuals for their expertise, ability to train others, and proficiency or tenure in the sport.

Although the SIM provides much basic information for skydivers, each jumper should research further and consult USPA and industry officials, documents, and other produced media, as well as other reliable individuals for clarification and additional information.

B. THE SIM AND SKYDIVING’S SELF-POLICING PRINCIPLE OF REGULATION

Although USPA is a voluntary membership association with no regulatory power, USPA can suspend or revoke any USPA license, rating, award, appointment, or membership it issues, according to terms and conditions stated in the USPA Governance Manual. Compliance with the Basic Safety Requirements (BSRs) contained herein is mandatory for participation in USPA programs. The BSRs represent the commonly accepted standards for a reasonable level of safety.

However, the recommendations contained herein, unless otherwise stated (such as in the case of compliance with a Federal Aviation Regulation), are put forth as guidance and are not mandatory. Moreover, a deviation from these recommendations does not necessarily imply negligence and is not to be used in a court of law to demonstrate negligence.

Voluntary compliance with rules, recommendations, and standards within the SIM demonstrates that jumpers and drop zone operators are exercising self-regulation.

D. HOW TO OBTAIN OR RECOMMEND CHANGES TO THIS MANUAL

The SIM from time to time requires updating. It is the responsibility of SIM holders to keep their version current. New copies and updates may be downloaded free of charge from the USPA website, www.uspa.org, or purchased from the USPA Store: (703) 836-3495; 836-2843 (fax), or e-mail store@uspa.org.

Readers are encouraged to submit comments or recommended changes in writing to USPA, 1440 Duke St., Alexandria, VA 22314; by phone to (703) 836-3495; by fax to (703) 836-2843; or by e-mail to uspa@uspa.org.

THIS MANUAL PROVIDES PROCEDURES TO ADDRESS MANY FORESEEABLE SITUATIONS, BUT EACH SITUATION IS DIFFERENT. DEVIATIONS FROM THESE RECOMMENDATIONS DOES NOT IMPLY NEGLIGENCE.
# TABLE OF CONTENTS

## WARNING

### INTRODUCTION

## SECTION 1: THE UNITED STATES PARACHUTE ASSOCIATION

### United States Parachute Association (Overview)

- A. Your USPA representatives ................................................................. 2
- B. USPA leadership ............................................................................... 2
- C. USPA policy making ........................................................................ 2
- D. The USPA headquarters staff .......................................................... 2
- E. USPA Constitution and By-Laws ...................................................... 2

## SECTION 2: BASIC SAFETY REQUIREMENTS AND WAIVERS

### Basic Safety Requirements (Overview)

- A. How the BSRs affect safety .............................................................. 5
- B. Waivers and changes to the BSRs ................................................... 5

### 2-1 Basic Safety Requirements

- A. Applicability .................................................................................. 6
- B. Compliance with Federal regulations .............................................. 6
- C. Medical requirements .................................................................... 6
- D. Age requirements .......................................................................... 6
- E. Student skydivers .......................................................................... 6
- F. Winds ............................................................................................ 7
- G. Minimum opening altitudes ............................................................. 7
- H. Drop zone requirements ................................................................. 7
- I. Pre-jump requirements ................................................................. 7
- J. Extraordinary skydives ................................................................. 7
- K. Parachute equipment ................................................................. 8
- L. Special altitude equipment and supplementary oxygen ............... 8

### 2-2 Waivers to the Basic Safety Requirements

- A. Why BSRs may need to be waived ............................................. 9
- B. Classification of waivers ............................................................... 9
- C. Procedures for filing waivers ......................................................... 9
- D. Filing of waivers ........................................................................... 9

## SECTION 3: CLASSIFICATION OF SKYDIVERS

### 3-1 USPA Licenses

- A. Background ............................................................................... 12
- B. General conditions for licenses ................................................... 12

APPENDIX C: USPA FORMS (VARIOUS) 209
THIS PAGE INTENTIONALLY LEFT BLANK
THE UNITED STATES PARACHUTE ASSOCIATION

Section Summary:

The United States Parachute Association is a membership organization, incorporated as a not-for-profit association, such that each regular member has an equal vote and an equal voice in establishing the policies of the Association.

In its sporting role, USPA is the official U.S. skydiving representative recognized by the National Aeronautic Association (NAA) and the official skydiving representative of the Federation Aeronautique Internationale (FAI) in the USA.

In its governing role, USPA is officially recognized by the Federal Aviation Administration (FAA) as the representative of skydivers in the United States.

USPA is an organization of skydivers, run by skydivers for skydivers, and it is your voice in skydiving. USPA keeps skydivers skydiving.
A. YOUR USPA REPRESENTATIVES

USPA Regional Directors are jumpers from your region of the country and are elected by you (and the other members within your region) to the USPA Board every two years. There are 14 USPA Regions and, therefore, 14 USPA Regional Directors. The USPA Board also includes eight National Directors, elected by the USPA membership at large.

Nearly all drop zones have a USPA Safety & Training Advisor (S&TA) who is appointed by and serves as your direct link to your USPA Regional Director. The S&TA is a local jumper who is available on your drop zone to provide you with administrative services and information.

B. USPA LEADERSHIP

The members of the USPA Board elect officers, including a president, vice president, secretary, treasurer, and chair of the board. The officers, together with an additional member-at-large, also elected from among the USPA Board members, make up the Executive Committee. The Executive Committee is responsible for making decisions and taking care of important matters that arise between the USPA Board meetings.

C. USPA POLICY MAKING

The USPA Board of Directors establishes USPA policies and procedures during meetings held twice a year. The board operates through a committee system comprised of USPA Board members with special qualifications and interests. Each of the committees provide guidance and advice in major areas of activity within the sport.

The actions of each working committee must be approved by the full USPA Board before becoming USPA policy. Each USPA Director has one vote at USPA Board meetings. Voting responsibility includes not only making business decisions and setting policy, but also the establishment and modification of the Basic Safety Requirements and official USPA Recommendations. USPA Board members cast their votes based on the input they receive from their constituency (the membership) and their own judgment.

D. THE USPA HEADQUARTERS STAFF

Between the meetings of the USPA Board, held twice each year, USPA’s administrative staff conducts the day-to-day business of the organization. The USPA board hires the Executive Director, who assumes all the various responsibilities and duties assigned by the USPA Board. The Executive Director, in turn, hires the staff, which operates from USPA Headquarters, in Alexandria, Virginia.

In summary, USPA Headquarters, led by the Executive Director, serves the USPA membership and carries out the instructions and policies set by the Board of Directors.

E. USPA CONSTITUTION AND BY-LAWS

USPA operates under a constitution and by-laws that define the organization’s purpose. They are contained in the USPA Governance Manual, available on USPA’s website or from USPA Headquarters.

section two

BASIC SAFETY REQUIREMENTS AND WAIVERS

Section Summary:

The Basic Safety Requirements (BSRs) have been established as the cornerstone of the self-policing principle upon which skydiving is based. They represent the industry standard generally agreed upon as necessary for an adequate level of safety. Research can be conducted to develop and document new methods and procedures within the BSRs and, when necessary, under waivers to the BSRs, to establish a justifiable basis to modify these standards. This section includes two fundamental, interrelated USPA publications: the Basic Safety Requirements and waivers to the Basic Safety Requirements.

Who needs this section?

- jumpers studying for license tests
- USPA instructional rating candidates
- drop zone staff responsible for setting policies
- USPA officials
A. HOW THE BSRs AFFECT SAFETY

1. The BSRs promote practices aimed at eliminating incidents in skydiving and, by doing so, make skydiving safe and enjoyable.
2. The BSRs are established by evaluating incidents and identifying their root causes.
3. Safety is accomplished by reducing the risk factors, which requires everyone involved in skydiving to:
   a. acquire knowledge and make a continuing effort to add to and improve that knowledge
   b. practice and prepare for both the expected and the unexpected
   c. evaluate the risk factors
   d. accurately evaluate personal capabilities and limitations
   e. stay alert and aware of surroundings
   f. keep options open
   g. exercise good judgment
4. Failure to follow the BSRs may not always result in an incident, but many incidents are the result of not following these risk reduction procedures.

B. WAIVERS AND CHANGES TO THE BSRs

1. Also included in this section, waivers to the BSRs describe procedures for approving and documenting exceptions to the BSRs.
   a. Waivers also provide for the responsible development of new techniques and methods.
   b. The BSRs are designed to establish safety standards for common situations; however, local circumstances may allow for greater tolerance in some cases.
   c. The purpose for filing a waiver is to document that the particular BSR has been evaluated in the individual case and that the prescribed deviation and conditions do not represent an unacceptable compromise of safety.
   d. waiverability
      (1) Each BSR is categorized as either waiverable or non-waiverable.
      (2) Those which are waiverable are categorized according to who may file the waiver.
2. The BSRs are changed from time to time by the USPA Board of Directors as equipment and practices develop and evolve.
Note: Each paragraph in the BSRs has a marginal notation of S, E, FB, or NW, which identifies its waiverability as indicated in Section 2-2.

A. APPLICABILITY [NW]
1. These procedures apply to all jumps except those made under military orders and those made because of in-flight emergencies. Voluntary compliance with these procedures will protect the best interests of both the participants and the general public.
2. A “skydive” is defined as the descent of a person to the surface from an aircraft in flight when he or she uses or intends to use a parachute during all or part of that descent.
3. All persons participating in skydiving should be familiar with the Skydiver’s Information Manual and all federal, state, and local regulations and rules pertaining to skydiving.

B. COMPLIANCE WITH FEDERAL REGULATIONS [NW]
1. No skydive may be made in violation of Federal Aviation Administration (FAA) regulations.
2. FAA regulations include the use of restraint systems in the aircraft by all skydivers during movement on the surface, takeoff, and landing.

C. MEDICAL REQUIREMENTS [NW]
1. All persons engaging in skydiving should:
   a. Carry a valid Class 1, 2, or 3 Federal Aviation Administration Medical Certificate; or
   b. Carry a certificate of physical fitness for skydiving from a registered physician; or
   c. Have completed the USPA recommended medical statement.
2. Any skydiver acting as parachutist in command on a tandem jump must possess an FAA Class 3 medical certificate or the equivalent.

D. AGE REQUIREMENTS
1. For jumps with a single-harness, dual parachute system, skydivers are to be at least, either:
   a. 18 years of age [FB]
   b. 16 years of age with notarized parental or guardian consent [NW]
2. For jumps with a tandem parachute system, skydivers are to be at least the age of legal majority. [FB]

E. STUDENT SKYDIVERS
Note: All references to USPA instructional rating holders apply to higher rating holders in that training discipline.
1. General [E]
   a. All student training programs must be conducted under the direction and oversight of an appropriately rated USPA Instructor until the student is issued a USPA A license.

2. First-jump course [E]
   a. All first-jump non-method-specific training must be conducted by a USPA Instructor or a USPA Coach under the supervision of a USPA Instructor.
   b. All method-specific training must be conducted by a USPA Instructor rated in the method for which the student is being trained.
3. All students must receive training in the following areas, sufficient to jump safely [E]:
   a. equipment
   b. aircraft and exit procedures
   c. freefall procedures (except IAD and static-line jumps)
   d. deployment procedures and parachute emergencies
   e. canopy flight procedures
   f. landing procedures and emergencies
4. Advancement criteria
   a. IAD and static-line [E]
      (1) All jumps must be conducted by a USPA Instructor in that student’s training method.
      (2) Before being cleared for freefall, all students must perform three successive jumps with practice deployments while demonstrating the ability to maintain stability and control from exit to opening.
   b. Harness-held program [NW]
      (1) All students must jump with two USPA AFF rating holders until demonstrating the ability to reliably deploy in the belly-to-earth orientation at the correct altitude without assistance.
      (2) All students must jump with one USPA AFF rating holder, exit safely, maintain stability, and deploy at the planned altitude without assistance prior to attempting disorienting maneuvers.
   c. All students must jump under the direct supervision of an appropriately rated USPA Instructor until demonstrating stability and heading control prior to and within five seconds after initiating two intentional disorienting maneuvers involving a back-to-earth presentation. [E]
   d. Tandem training jumps [E]
      (1) All tandem training jumps must be conducted by a USPA Tandem Instructor.
      (2) For progressive training requirements following tandem jumps, refer to “Crossover training.”
e. Other tandem jumps [E]
   (1) Jumpers not rated as USPA Tandem Instructors who successfully complete a tandem instructor course in accordance with FAR 105.45 may act as a parachutist in command on tandem jumps.
   (2) Any jumper acting as tandem parachutist in command must meet the recent experience requirements for USPA Tandem Instructors.
(3) Intentional back-to-earth or vertical orientations that cause tandem freefall speeds exceeding that of droguefall are prohibited.

f. Tandem equipment experience: [E]
   (1) Before acting as parachutist in command or instructor on a tandem jump, a skydiver must satisfactorily complete an FAA-approved course of instruction on that equipment.
   (2) Tandem equipment instruction must be conducted by an individual approved by the tandem equipment manufacturer of that system.

5. Crossover training [E]
   a. Students may transfer after the first or subsequent jumps to another training method after demonstrating sufficient knowledge and skill in the areas of equipment, aircraft, exits, freefall maneuvers, deployment, emergency procedures, canopy control, and rules and recommendations to enter into that program at a comparable level of proficiency and training.
   b. Students previously trained in a tandem program may continue in a harness-hold program or must demonstrate a solo exit and practice deployment with stability in the IAD or static-line program prior to advancing to freefall.
   c. Students previously trained in a harness-hold program must have exited stable without assistance or performed a stable IAD or static-line jump with a practice deployment supervised by a USPA IAD or Static-Line Instructor prior to performing freefall jumps with any non-AFF-rated USPA Instructor.

6. Students training for group freefall [S]
   a. All student freefall training for group freefall jumps must be conducted by a USPA Coach under the supervision of a USPA Instructor.
   b. All students engaging in group freefall jumps must be accompanied by a USPA Coach until the student has obtained a USPA A license.

7. Instruction of foreign students [E]
   a. Foreign non-resident instructional rating holders appropriately and currently rated by their national aero club may train students from that nation in the U.S., provided the instruction is conducted in accordance with the USPA Basic Safety Requirements.
   b. Appropriately and currently rated USPA instructional rating holders may assist in this training.

8. No skydiver will simultaneously perform the duties of a USPA instructional rating holder and pilot-in-command of an aircraft in flight. [NW]

9. All student jumps must be completed between official sunrise and sunset. [NW]

F. WINDS [S]

Maximum ground winds

1. For all solo students
   a. 14 mph for ram-air canopies
   b. 10 mph for round reserves

2. For licensed skydivers are unlimited

G. MINIMUM OPENING ALTITUDES [E]

Minimum container opening altitudes above the ground for skydivers are:

1. Tandem jumps–4,500 feet AGL
2. All students and A-license holders–3,000 feet AGL
3. B-license holders–2,500 feet AGL
4. C- and D-license holders–2,000 feet AGL

H. DROP ZONE REQUIREMENTS

1. Areas used for skydiving should be unobstructed, with the following minimum radial distances to the nearest hazard: [S]
   a. solo students and A-license holders—100 meters
   b. B- and C-license holders—50 meters
   c. D-license holders—unlimited

2. Hazards are defined as telephone and power lines, towers, buildings, open bodies of water, highways, automobiles, and clusters of trees covering more than 3,000 square meters. [NW]

3. Manned ground-to-air communications (e.g., radios, panels, smoke, lights) are to be present on the drop zone during skydiving operations. [NW]

I. PRE-JUMP REQUIREMENTS [NW]

The appropriate altitude and surface winds are to be determined prior to conducting any skydive.

J. EXTRAORDINARY SKYDIVES

1. Night, water, and demonstration jumps are to be performed only with the advice of the local USPA S&TA, Instructor Examiner, or Regional Director. [NW]

2. Pre-planned breakaway jumps are to be made by only class C- and D-license holders using FAA TSO’ed equipment. [E]

3. Demonstration jumps into level 2 areas require a D license with a USPA PRO Rating for all jumpers, including both tandem jump participants. [E]

4. Contact canopy formation activity is prohibited on tandem jumps. [E]

5. Tandem jumps into stadiums are prohibited. [E]
K. Parachute Equipment

1. Each skydiver is to be equipped with a light when performing night jumps. [NW]

2. All students are to be equipped with the following equipment until they have obtained a USPA A license:
   a. a rigid helmet (except tandem students) [NW]
   b. a piggyback harness and container system that includes a single-point riser release and a reserve static line, except: [FB]
      (1) A student who has been cleared for freefall self-supervision may jump without a reserve static line upon endorsement from his or her supervising instructor.
      (2) Such endorsement may be for one jump or a series of jumps.
   c. a visually accessible altimeter [NW]
   d. a functional automatic activation device that meets the manufacturer’s recommended service schedule [FB]
   e. a ram-air main canopy suitable for student use [FB]
   f. a steerable reserve canopy appropriate to the student’s weight [FB]
   g. for freefall, a ripcord-activated, spring-loaded, pilot-chute-equipped main parachute (except tandem students) or a bottom-of-container (BOC) throw-out pilot chute [FB]

3. Students must receive additional ground instruction in emergency procedures and deployment-specific information before jumping any unfamiliar system. [NW]

4. For each harness-hold jump, each AFF rating holder supervising the jump must be equipped with a visually accessible altimeter. [NW]

5. All skydivers wearing a round main or reserve canopy and all students must wear flotation gear when the intended exit, opening, or landing point is within one mile of an open body of water (an open body of water is defined as one in which a skydiver could drown). [S]

L. Special Altitude Equipment and Supplementary Oxygen

Supplementary oxygen available on the aircraft is mandatory on skydives made from higher than 15,000 feet (MSL). [NW]
WAIVERS TO THE BASIC SAFETY REQUIREMENTS

A. **Why BSRs May Need to Be Waived**

1. The Basic Safety Requirements represent commonly accepted standards necessary to promote safety in average conditions.
2. Since these standards may be an unnecessary burden in some individual circumstances, USPA provides procedures to document exceptions, known as waivers to the BSRs.
3. These waivers also provide for the responsible research and development of improved techniques and methods.

B. **Classification of Waivers**

1. Waivers to the Basic Safety Requirements are filed at three levels:
   a. the USPA Safety & Training Advisor (S&TA) or USPA Instructor Examiner
   b. the Executive Committee of USPA
   c. full Board of Directors of USPA
2. Neither USPA Headquarters nor any other person or group of persons except those here stated has the authorization to file a waiver to any BSR.
3. Each paragraph of the BSRs will be identified as to who is required to file the waiver.
   a. S&TA or Instructor Examiner only [S]
   b. Executive Committee of the USPA Board only [E]
   c. full Board of Directors only [FB]
   d. may not be waived [NW]

C. **Procedures for Filing Waivers**

1. Waivers are to be filed only when the person(s) filing the waiver is assured that there will be no compromise of safety.
2. Inspections
   a. The person(s) filing the waiver should make periodic inspections to ensure that safety is not being compromised and to determine if the waiver should be rescinded.
   b. In the case of waivers by the Executive Committee, the Regional Director will perform these inspections and make recommendations to the Board.
3. Any waiver filed by an S&TA or Instructor Examiner will be in writing, and a copy of the waiver will be sent to both the USPA Regional Director and USPA Headquarters.
4. S&TAs are not to file waivers for skydiving activities outside their assigned area.
5. If there is a conflict between an S&TA and an Instructor Examiner as to whether a waiver should be filed, the decision of the S&TA will be final.
6. The Executive Committee or full Board of Directors will not file a waiver without consulting and notifying the local S&TA and USPA Regional Director.
7. The waiver filing authorization code [NW] must first be eliminated by a vote of the full BOD before the BSR can be waivered.

D. **Filing of Waivers**

1. Persons filing waivers will maintain permanent records of all waivers filed by themselves.
   a. The S&TA and Regional Director will maintain permanent records of all waivers filed for skydiving activities within their area.
   b. The records will be kept in such a manner as to indicate those waivers currently in effect and those which have been rescinded.
2. USPA Headquarters will maintain a permanent record of all waivers.
CLASSIFICATION OF SKYDIVERS

Section Summary:

Skydivers can qualify for and receive a variety of licenses and ratings according to their experience, skill, and knowledge level.

USPA Licenses are essentially documents of proficiency and are divided into four classes from the lowest to highest levels: A, B, C, and D.

Many skydivers also pursue ratings which require qualifications in addition to those required for licenses. Three separate types of ratings can be obtained as an individual develops expertise in a specific area: student instruction, professional demonstration jumping, and competition judging. The FAA also issues ratings of interest to skydivers.

This section of the SIM describes the requirements and privileges of USPA licenses. For more details on the USPA instructional ratings, see the USPA Instructional Rating Manual. For the USPA PRO Exhibition rating, see SIM Section 7, “Exhibition Jumping.” For information on competition judging, see the USPA Skydiver’s Competition Manual. And for FAA ratings, refer to the FAA documents included in this manual.
A. BACKGROUND

1. License requirements are intended to encourage the development of the knowledge and skills which should be acquired by each skydiver as experience is gained.

2. USPA licenses, recognized in all FAI member countries, serve as official documentation that the stated experience and skills have been attained.

3. Licenses are a valuable instructional tool in that they serve both as goals to be accomplished and as a guideline to acquire the skills and knowledge necessary to provide a reasonable level of safety and enjoyment.

4. USPA license authority
   a. The United States Parachute Association is authorized by the National Aeronautic Association and the Federation Aeronautique Internationale to issue internationally recognized sporting licenses.
   b. Licenses are issued based upon demonstration of skill, knowledge, and experience and are ranked according to the level of accomplishment.

B. GENERAL CONDITIONS FOR LICENSES

1. USPA licenses are valid only while the holder is a current regular USPA member; there is no other renewal requirement.

2. USPA licenses are valid in all FAI member countries and, while valid, entitle the holder to participate in open skydiving events organized in FAI member countries.

3. USPA issues licenses only to USPA members who meet the conditions set forth for that license.

4. License qualifications made during military training jumps may be properly recorded on the application for that USPA license and verified by the appropriate USPA official.

5. Total freefall time is defined to include both freefall and droguefall time.

6. USPA licenses may be refused, suspended, or revoked only when authorized by the USPA Board of Directors or in compliance with existing USPA Board directives.

C. LOGGING JUMPS FOR LICENSES AND RATINGS

1. Skydives offered as evidence of qualification must have been:
   a. made in accordance with the USPA requirements in effect at the time of the jump
   b. legibly recorded in chronological order in an appropriate log that contains the following information:
      (1) jump number
      (2) date
      (3) location
      (4) exit altitude
      (5) freefall length (time)
      (6) type of jump (formation skydiving, freeflying, canopy formation, style, etc.)
      (7) landing distance from the target
      (8) equipment used
      (9) verifying signature

2. Jumps for license and rating qualifications must be signed by another licensed skydiver, a pilot, or a USPA National or FAI Judge who witnessed the jump.

3. Jumps to meet skill requirements must be signed by a USPA Instructor, Instructor Examiner, Safety & Training Advisor, or a member of the USPA Board of Directors.

D. VERIFICATION OF APPLICATION

1. Experience verification: The certifying official should verify that the number of jumps and total freefall time are correct and meet the listed requirements for the license sought.

2. Skill verification: Jump numbers, scores, or date of completion require the initials of a current USPA Instructor, S&TA, I/E, or USPA Board member.

3. Knowledge verification: For the B, C, and D license, the certifying official should make sure that the exam answer sheet(s) is forwarded along with the application.

4. Signature Verification: Applications for all licenses must be signed by an appropriate official before the application is forwarded to USPA Headquarters.
   a. USPA Instructors may verify A, B, and C licenses.
   b. S&TAs, I/Es, and USPA Board members may verify any license application.

E. LICENSE PRIVILEGES AND REQUIREMENTS

A License

1. Persons holding a USPA A license may pack their own main parachute, engage in basic group jumps, perform water jumps, and must have
   a. completed 20 jumps
   b. completed all requirements listed on the USPA A License Proficiency Card
   c. received the signature and official stamp on the USPA A License Proficiency Card or USPA A License Progression Card (ISP)

Note: For USPA A-license registration purposes only, USPA Headquarters will accept either completed card signed by a USPA Instructor (signature on file at USPA Headquarters) without the official stamp. The registration fee must be included.
B License

2. Persons holding a USPA B license are able to exercise all privileges of an A-license holder, perform night jumps, and must have
   a. obtained a USPA A license
   b. completed 50 jumps including:
      (1) accumulated at least ten minutes of controlled freefall time
      (2) landed within ten meters of target center on ten jumps
   c. demonstrated the ability to perform individual maneuvers (a figure 8, backloop, figure 8, backloop) in freefall in 18 seconds or less
   d. documentation of live water landing training with full equipment in accordance with the procedures in the Skydiver’s Information Manual
   e. passed a written exam conducted by a current USPA I, I/E, S&TA, or USPA Board member.

C License

3. Persons holding a USPA C license are able to exercise all privileges of a B licensed jumper, are eligible for the USPA Coach ratings, may ride as passenger on USPA Tandem Instructor training and rating renewal jumps, and must have—
   a. met all current requirements for or hold a USPA B license
   b. completed 100 jumps including accumulating at least 20 minutes of controlled freefall time
   c. landed within five meters of target center on 20 jumps
   d. completed at least four points on a 4-way or larger random skydive or perform individual maneuvers (a figure 8, backloop, figure 8, backloop) in freefall in 15 seconds or less
   e. Passed a written exam conducted by a current USPA AFF, IAD, or Static-Line Instructor, I/E, S&TA, or USPA Board member.

D License

4. Persons holding a USPA D license are able to exercise all privileges of a C license holder, participate in certain demonstration jumps, are eligible for all USPA ratings, and must have—
   a. met all current requirements for or hold a USPA C license
   b. completed 200 jumps including accumulating at least one hour of controlled freefall time
   c. landed within two meters of target center on 25 jumps
   d. demonstrated the ability to perform individual maneuvers (either of the following):
      (1) during freefall, perform in sequence within 18 seconds—a backloop, front loop, left 360-degree turn, right 360-degree turn, right barrel roll and left barrel roll
      (2) completed at least two points on an 8-way or larger random skydive
   e. made two night jumps (one solo and one in a group) with a freefall of at least 20 seconds
      (1) with verification of prior night jump training from a USPA Instructor
      (2) with the advice of an S&TA, in accordance with USPA BSRs
   f. passed a written exam conducted by a current USPA I/E, S&TA, or a USPA Board member.

F. Restricted USPA Licenses

1. Under extreme circumstances, such as physical handicaps, a USPA Restricted license may be issued to applicants who are unable to meet all of the specific license requirements.
2. A person may be qualified for a Restricted license if the rating holder has (all of the following):
   a. submitted a petition to the Safety & Training Committee, containing:
      (1) type of license requested
      (2) specific license requirement(s) which cannot be met
      (3) circumstances which prevent compliance with license requirements
      (4) license application completed, except for the restricted activities
   b. met all requirements for the license desired except for those listed in the petition
3. Each application will be considered individually on its own merit, totally without precedent.
4. Restricted license numbers will be followed by the letter “R” (e.g., C-11376R).
A. LICENSE EXAM INSTRUCTIONS

1. A license:
   a. The examining USPA Instructor conducts an oral quiz of at least 20 questions taken from the USPA Integrated Student Program syllabus, with emphasis on the following:
      (1) cloud clearance and visibility requirements
      (2) equipment operation and maintenance
         (i) wing loading and its effects
         (ii) closing loop
         (ii) velcro and tuck flaps
         (ii) packing and authorization to pack
      (3) canopy flight
         (i) traffic patterns and collision avoidance
         (ii) braked turns and obstacle avoidance
         (iii) low turn avoidance and recovery
         (iv) downwind landing procedures
         (v) obstacle landing emergency and recovery procedures
      (4) aircraft procedures
         (i) during jump run and exit to observe balance limits
         (ii) distance between groups to maintain separation
         (iii) aircraft emergency procedures
      (5) group breakoff recommendations
   b. The examining USPA Instructor conducts or arranges the review training required for the student to answer all questions correctly.
   c. The examining USPA Instructor conducts a skydive with the applicant to verify practical knowledge in the following areas:
      (1) choosing the spot and selecting and guiding the pilot to the correct exit and opening point in routine conditions
      (2) pre-jump equipment checks for self and others
      (3) planning an effective group break-off
      (4) two figure-8s and a backloop
      (5) docking from 20 feet (evaluator flies into position)
      (6) breakoff altitude recognition and tracking for a minimum of 100 feet
      (7) signal before deployment and overall awareness during and after deployment
   d. Once the student has successfully completed the A-license check dive and answered all questions correctly on the oral exam, the certifying USPA Instructor may sign the student’s A License Proficiency Card or the approved equivalent and apply the official USPA A-license stamp as proof of license qualification.

2. For B, C, and D licenses, the examining USPA official:
   a. gives the applicant an answer sheet and the questions to the exam
      (1) No references or other assistance are permitted during the exam.
      (2) After the test, the examining official collects the materials and grades the exam.
      (3) A score of 75% (15 correct answers or more) is required to pass.
   b. The score is recorded on the license application and in the applicant’s logbook.
      (1) The applicant not passing will be eligible to retake this exam after seven days.
      (2) To qualify for a higher license, the applicant must possess a USPA license and have passed all lower class license exams.

B. PRESENTING A COMPLETED LICENSE APPLICATION

1. A license
   a. The completed A license Proficiency Card or approved equivalent, signed by the certifying USPA Instructor and bearing the official A-license stamp, is proof of a USPA A license.
   b. An A license holder may permanently register the license with USPA by sending a copy with the appropriate license registration fee:
      (1) Fax both sides of the license to USPA with a credit card authorization.
      (2) Photocopy both sides of the license and mail it with payment.
      (3) A completed and signed A-License applications need not be stamped to be registered with USPA (USPA keeps a copy of all USPA Instructor signatures on file); however, an A License Proficiency Card is not considered official unless stamped or until a license number is issued.

2. B, C, and D license applicants may mail or fax their completed application, including written examination answer sheet and test score, with the appropriate fee to USPA Headquarters.
3. Once any new license has been registered with USPA, the applicant will receive a new membership card with the license number, which is also published in Parachutist Magazine.

C. LICENSE APPLICATION CHECKLIST

1. The verifying official signing the license application should check that each of these items has been completed:
   a. applicant’s personal information
   b. experience verification
      (1) number of jumps
      (2) freefall time, if applicable
   c. skill verification

2. The official verifies (by initialing) either that:
   a. The jump number, date, or score for each requirement is correct and can be found in the applicant’s logbook.
   b. If applicable, the applicant’s appropriate license number is included with the application.

3. Official verifying B, C, and D licenses
   a. check that the written exam answer sheet is complete with a passing score
   b. sign and print name, title, and date
A. USPA INSTRUCTIONAL RATINGS

USPA issues instructional ratings to each skydiver who qualifies by fulfilling all requirements for the rating being sought. These ratings attest that the holder has not only achieved skydiving skills but has also demonstrated the techniques needed to teach these skills to others.

1. Ratings are issued at the following levels (from lowest to highest):
   a. Coach
   b. Instructor
   c. Instructor Examiner

2. USPA Instructors may be qualified to conduct initial skydiving training in one or more disciplines:
   a. harness hold (USPA Accelerated Freefall or AFF)
   b. instructor-assisted deployment
   c. static line
   d. tandem

The USPA Coach may act as a supervised assistant to the USPA Instructor to teach specified portions of the first-jump course. Any USPA instructional rating holder may perform the duties of the USPA Coach or of any lower rating holder in his or her discipline.

USPA appoints qualified instructional rating holders as course directors and evaluators in accordance with the requirements outlined in the USPA Instructional Rating Manual. All policies, procedures, new rating and renewal requirements, and the rating course outlines, support materials and examinations are found in the USPA Instructional Rating Manual.

B. USPA PRO PROFESSIONAL EXHIBITION RATING

The Federal Aviation Administration and USPA cooperate on an alternative means for skydivers to demonstrate competence to perform skydiving shows before the public via a USPA PRO Exhibition rating. The program is described in the Exhibition Jumping Section of the SIM. The FAA may ask jumpers who do not hold a USPA PRO rating to demonstrate competence prior to issuing a Certificate of Authorization to conduct a parachute exhibition jump.

C. USPA JUDGE RATING

To assist in the administration of skydiving competitions at various levels from local and regional to World Championships, USPA conducts the USPA Judge program. Judges are rated as Regional, National, and International. Details on the USPA Judge rating program and the National Judge Training Course are detailed in the USPA Skydiver’s Competition Manual.

D. FAA RATINGS

The Federal Aviation Administration administers the programs that certify parachute riggers, aircraft mechanics, and pilots. The rules for these drop zone staff members are found in the Federal Aviation Regulations, many pertinent parts of which are included in the SIM Section, FAA Documents.

Skydiving students study the role of the rigger and supervised packers in detail while preparing for the USPA A license using the Integrated Student Program in the SIM. In addition, they overview pilot rating requirements and the role of the FAA mechanic.
USPA INTEGRATED STUDENT PROGRAM

Section Summary:

Regardless of discipline, the USPA Integrated Student Program advances students through eight categories of proficiency (A-H) to qualify them for their USPA A license.

Each student completes a series of required skills and knowledge sets while making the prescribed training jumps in each category. At the end of each category, a student in any training discipline has achieved similar skills and knowledge. The number of jumps to complete each category depends on the training discipline and the student’s performance.

When a student completes the requirements for each category, the USPA Instructor records it on the student’s USPA A-License Application and administers an oral quiz. Especially in Categories A-D, the student should complete all the objectives of one category before making any jumps in the next.

An appropriately-rated USPA Instructor must directly supervise each student jump until the student is cleared to self supervise in freefall during Category E. A USPA Coach or the USPA-approved equivalent may conduct freefall training and supervise jumps for those students in Categories E through H. Until the USPA A license, all student training remains the responsibility of the USPA Instructor.

Once meeting all the requirements listed on the USPA A-License Application, the student may then make a check jump with a USPA Instructor to be issued the USPA A license. The check jump consists of an overall review of the training and includes an oral quiz taken from the quizzes at the end of each category.

The USPA Integrated Student Program provides one effective and detailed progression for training students for their A license. It is not a required program or the only good training outline. However, students should ensure that the training program at their school meets the USPA standards outlined in the Basic Safety Requirements.

Who needs this section?

- skydiving students
- instructional rating holders
- drop zone staff developing student training programs

*After training recommended in the USPA Integrated Student Program for solo students coming from tandem.*
SECTION 4-2

CATEGORIES A-H: OBJECTIVES OVERVIEW

CATEGORY A
all—
• canopy control
• landing approach
• landing principles
• exit
• stable fall
• deployment
• aircraft emergencies

solo students—
• equipment emergencies
• landing emergencies

CATEGORY B
• relaxing in the skydiving environment
• heading awareness
• parachute deployment
• more on the landing pattern
• airport orientation
• protecting handles
• equipment emergency review

CATEGORY C
• unassisted freefall with heading awareness
• hover control
• solo deployment
• landing patterns for higher winds
• wing loading
• accidental opening review
• turbulence
• landing off
• obstacle recognition
• the FAA rigger
• the closed parachute system

CATEGORY D
• solo, unassisted exit (AFF students)
• freefall turns
• freefall speeds and times review
• back riser control
• building landing review
• AAD (owner’s manual)
• pre-jump equipment check
• introduction to three-ring release operation
• cloud clearance and visibility
• observe jump run

CATEGORY E
• door (unpoised) exit
• recovering stability and awareness

• aerobatics
• stalls
• the canopy’s “sweet spot”
• two canopies deployed (review)
• high-wind landings
• reserve static line
• open parachute orientation
• parachute packing and supervision
• wind limits
• aircraft briefing
• aircraft emergency procedures
• selecting the opening point

CATEGORY F
• introduction to tracking
• two clear and pulls (former AFF students)
• braked turns, approaches, and landings
• extending the glide
• acting as jumpmaster or jump leader
• power-line landing review
• packing with assistance
• checking others’ equipment
• procedures following inactivity
• winds aloft and the exit point
• separating groups during exit

CATEGORY G
• group exits
• floater position
• forward and backward movement
• adjusting fall rate
• start and stop
• docking
• maximum-performance canopy turns
• collision avoidance and response review
• tree landing review
• equipment maintenance inspection
• weather for skydivers

CATEGORY H
• diver exit
• swooping
• breakoff
• front riser control
• water landing review
• owner maintenance of gear
• aircraft radio requirements
• FAA notification requirements for jumping
• FAA approvals for jump planes
THIS PAGE INTENTIONALLY LEFT BLANK
A. RECOMMENDATION

USPA recommends that skydivers complete training in the Integrated Student Program (ISP), an effective means of preparing a student for the USPA A license.

B. WHAT IS THE ISP?

1. USPA developed the ISP as a comprehensive training outline that meets the USPA Basic Safety Requirements for student training in all method-specific disciplines.
   a. Some schools have developed equivalent programs that train the student to meet all the qualifications of the USPA A license.
   b. A prospective student should be able to ask a school to compare its program against this industry standard program.

2. USPA recognizes the following training methods, or disciplines:
   a. USPA Accelerated Freefall (harness hold), where the student exits with two instructors who hold the student’s parachute harness for guidance and observation.
   b. Instructor-assisted deployment (IAD) and static line, the same method using different equipment during the initial jumps
      (1) pilot chute deployed by the instructor as the student exits (instructor-assisted deployment)
      (2) deployment via a static attachment to the aircraft that separates once the parachute deploys (static line)
   c. tandem, where the student’s harness is attached to the front of the instructor’s, who is wearing a specially designed and built parachute system for tandem skydiving
   d. vertical wind tunnel training, where a student receives instruction and practices basic freefall control and maneuvering under the supervision of a qualified skydiving instructor

3. As they progress through the advancement categories of the ISP, students training in one method demonstrate an equivalent level of knowledge and skill as ISP students trained in other methods.

C. CHOOSING A SCHOOL

1. Many regions are served by more than one skydiving center, and a prospective student should shop around.
2. Ask questions (personal observation is even better) about the types of training offered, the type of equipment used, staff qualifications, etc.

3. Skydiving schools are often listed in the local yellow pages under “parachute” or “skydiving.”
4. USPA maintains a list of current Group Member drop zones on the USPA website, www.uspa.org.

D. WHAT TO EXPECT

1. Registration
   a. Upon arrival at the jump center, register with the skydiving school.
   b. All jumpers will be required to fill out a registration form which will usually ask for name, address, age, height, weight, occupation and the name, address, phone number, and relationship of someone to contact in case of emergency.

2. Liability release
   a. Each participant will also be required to agree to and sign a liability release.
   b. This release will verify that the person understands that there is risk involved in skydiving and that the participant freely agrees to accept that risk.
   c. The legal release will usually contain a contract or covenant by which the participant agrees not to sue the skydiving school or anyone else if the participant is injured.

3. All participants in skydiving must meet the USPA Basic Safety Requirements for medical fitness.
   a. A person should be in good health and physical condition to skydive and should not be on medication, but some conditions can be properly managed if the instructor knows about them.
   b. A FAA flight physical or a doctor’s statement of fitness for skydiving may be required in some cases.

---

**USPA STATEMENT OF MEDICAL FITNESS**

“I represent and warrant that I have no known physical or mental infirmities that would impair my ability to participate in skydiving, or if I do have any such infirmities, that they have been successfully treated so that they do not represent any foreseeable risk while skydiving, or that they are being successfully treated so that they do not represent any foreseeable risk while skydiving.

“I also represent and warrant that I am not taking any medications or substances, prescription, or otherwise, that would impair my ability to participate in skydiving.”
c. The instructor also needs to know about any recent donations of blood.
d. People who participate in SCUBA diving should not fly for at least 24 hours afterward.
e. height and weight
   (1) The table “Student Height-Weight Guidelines” is provided as a guide to help determine physical fitness.
   (2) Anyone more than 10% above or below the indicated weight for their height, or anyone over 50 years of age, should demonstrate an adequate level of strength and agility before beginning training.
4. All participants in skydiving must meet the BSRs for age.
a. Minors who are at least 16 years of age and have notarized parental or guardian consent may be allowed to participate in some training programs at some schools, according to the law and school policy.
b. The person providing consent for a minor may be required to observe all pre-jump instruction.
5. Testing
a. Upon completion of ground school and before the first jump, it is common practice and good teaching procedure for all students to be required to pass written, oral, and practical tests.

(1) Written tests should be designed to have the student explain his or her knowledge and understanding.
(2) Oral tests should be used to develop decision making ability.
(3) Practical tests should be designed so the student can demonstrate reactions and skills.
b. Tests will not only assure the instructor that the student has learned, but will also give the student confidence that he or she has learned how to safely make a skydive.

E. STUDENT EQUIPMENT
1. Students are provided with additional safety devices not usually found on equipment used by non-students.
2. Special requirements for student parachute systems are listed in the USPA Basic Safety Requirements (BSRs).
a. From the start, a student should be taught to be self-reliant and to respond quickly to emergency situations.
b. Safety devices and features should be designed so they will be used as emergency overrides or backups only, in the event that the student does not properly perform emergency procedures.
c. Students should never use these features as a substitute for proper training and supervision or to give confidence to the student, but rather to give peace of mind to the instructor by providing multiple safety backup systems.

</tbody>
</table>
3. Student equipment should be well maintained.

4. Standardization
   a. Changes in type of equipment should be avoided or minimized whenever possible during student training.
   b. When changes are made, adequate transition training must be provided in compliance with the BSRs.
   c. Foresight should be used to minimize the need to change emergency procedures as a student progresses.

5. Canopies used for students should be large, docile, and appropriate for the student’s weight.

F. Training Priorities

1. The most important skill a skydiver must develop is the ability to cope with and respond to emergency situations.

2. Development of these skills should start with the first jump rather than at a point where supervision of jumping activities is reduced.

3. Initial training, even if the student intends to make only one jump, should be designed to establish a foundation for the continuing growth and development of skills.
THIS PAGE INTENTIONALLY LEFT BLANK
**CATEGORY A—INTRODUCTION**

This first category of the ISP includes the first-jump course, presented according to your training discipline.

A USPA Coach may teach the solo general section, which contains topics and procedures common to all solo first jumpers in the AFF, IAD, or static-line programs. A USPA Instructor in that student’s training discipline is required to teach any sections unique to the student’s training method.

Tandem skydivers may either train for only the minimum information required to make a tandem jump safely or to meet the Category A advancement criteria. The choice depends on the agreement between the tandem student and the school. Tandem training is conducted or supervised by a USPA Tandem Instructor, who may be assisted by a USPA Coach.

Included in all ISP categories are recommended minimum deployment altitudes and the number of skydives it takes on the average to complete that category of training (blue strip at right). They vary within a category, according to your training discipline.

On the page following each category introduction is a category overview called “Category at a Glance.” It lists the advancement criteria you should meet before progressing to the next category of training. The school should provide you a USPA A-License Card and begin checking off training sessions and advancement criteria early in the training program.

At the end of each category is an oral quiz to be conducted with you by the supervising USPA Instructor. The quiz is based on topics from the training outline and the recommended readings (“book stuff”), which are listed with the “Category at a Glance.”

Following each training outline are recommended skydive procedures for freefall and under canopy (dive flows), as well as some notes for the supervising USPA Instructor.

Naturally, Category A includes the longest training outline, because there is a lot you must learn prior to making a first skydive. To improve retention, the school introduces only what you might need to know to make a first jump safely. (The minimum amount to be covered is included in SIM Section 2-1, the USPA Basic Safety Requirements.) Other important information can be presented as it becomes relevant and as you make a firmer commitment to learning more about the sport.

**AFF AND TANDEM**
- one jump
**IAD-STATIC LINE**
- two jumps
**RECOMMENDED MINIMUM DEPLOYMENT**
**AFF**
- 4,500 feet
- IAD and static line
- 3,500 feet
- tandem
- 5,500 feet
EXIT AND FREEFALL

AFF AND TANDEM STUDENTS
• reasonable arch and stability within ten seconds prior to planned deployment altitude
• reasonable altitude awareness
• initiate deployment procedures within 1,000 feet of the assigned altitude

STATIC-LINE AND IAD STUDENTS
• establish an arch and reasonable control after exit

CANOPY
• execute canopy descent and pattern strategy with assistance
• assisted flare for a safe landing within 60 degrees of heading into the wind
• land within 100 meters of the planned landing area, spot permitting

*Note: For reasons of safety, AFF, IAD, or static-line students who do not complete the flaring and landing advancement criteria on the first jump should be recommended for tandem or other comprehensive canopy training. If all other Category A advancement criteria have been met, the student may satisfy Category A canopy skills in another discipline and then advance to Category B in the preferred discipline.

ORAL QUIZ
• FAR 91.107.a on seat belt use and responsibilities
• SIM Section 2-1 E.3 on the topics to be covered in the first-jump course
I. SOLO: GENERAL SECTION

Note: The needs of the operation will determine the order of presentation of the topics taught in the first-jump course. This section may be taught by a USPA Coach under the supervision of any USPA Instructor.

A. SOLO EQUIPMENT ORIENTATION

1. Location of all operation handles
2. Equipment responsibilities
   a. In Category A, the USPA Instructor takes responsibility for putting your equipment on, adjusting it correctly, and checking it as follows:
      (1) before you put it on
      (2) before boarding
      (3) in the aircraft shortly before exit
   b. Static-line and IAD students check their deployment devices before climbing out of the aircraft.
   c. With the instructor’s assistance, the student protects all operation handles while in and around the aircraft.
3. The altimeter indicates altitude in thousands of feet from the ground.
   a. care in handling
   b. reads only approximate altitudes
   c. sometimes fails
   d. use of the altimeter in freefall:
      (1) Skydivers freefall about 1,000 feet in the first ten seconds and 1,000 feet every 5.5 seconds thereafter.
      (2) The altimeter needle moves backwards at approximately the same speed as the second hand of a clock.
      (3) Freefall students should check the altitude—
         (i) after every task
         (ii) whenever encountering difficulty in completing the current task
         (iii) whenever uncertain of the altitude
         (iv) continually every few seconds
      (4) If you don’t know the altitude, open the parachute.
   e. Static-line and IAD students count to keep track of the seconds after exit.
   f. All students use the altimeter under canopy.
   g. Altitude awareness is the skydiver’s most important task until the parachute opens.
4. Parachute opening occurs in three stages:
   a. Activation—Opening the parachute container begins deployment.
      (1) extracting the ripcord
      (2) throwing the pilot chute
      (3) coming to full extension of the static line
   b. Deployment—The pilot chute or static line extracts the parachute from the container.
   c. Inflation—The canopy fills with air.
5. Within three seconds after activation, determine whether or not the canopy has deployed, inflated properly, and is controllable.
6. The open parachute canopy
   a. To land safely, the parachute canopy must be regular in shape and controllable, and you must be able to reliably steer and flare the canopy for landing.
      (1) rectangular (may be slightly tapered) canopy overhead with untangled suspension and steering lines
      (2) suspension and steering lines connect to four straps above the jumper’s harness, called risers
      (3) slider: a rectangular piece of fabric at the top of the risers
         (i) moves down the lines during inflation.
         (ii) slows and organizes the opening.
      (4) steering handles, called “toggles” or “brakes,” one on the back of each rear riser.
B. FREEFALL POSITION

1. Skydivers first learn to fall belly first into the wind.
   a. Falling belly first results in a more reliable deployment of the parachute, worn on the back.
   b. The airflow comes at first from opposite the direction of the aircraft’s flight.
2. Arching and extending the legs slightly results in better belly-first control; and relaxing the rest of the body results in smooth, on-heading fall.
   a. hips forward with back arched
   b. knees at shoulder width
   c. legs extended slightly, knees bent 45 degrees, toes pointed
   d. upper arms positioned 90 degrees or less from the torso and relaxed
   e. elbows bent 90-120 degrees, up, and relaxed
   f. head up
   g. practice until natural
3. Consciously breathing will help you relax in this position while in the exciting freefall environment.
4. Communications
   a. Using hand signals (some examples are shown in SIM Appendix A), the instructor may coach you for a better body position and to improve awareness.
   b. Your method-specific instructor will introduce you to the signals he or she may use.
   c. You should respond to all body adjustment signals smoothly and slowly and maintain the new position.

C. MAIN DEPLOYMENT (FREEFALL ONLY)
   1. Establish belly-to-wind (arched) body position.
   2. Maintain the arch and locate the deployment handle.
      a. If the deployment handle is mounted on the bottom of the container, look up while reaching for the handle.
      b. Ripcords mounted more forward may allow you to look at the ripcord before reaching.
      c. Regardless of location or technique, accentuate the arch while reaching for the activation handle.
   3. For equal deflection of air (balance), stretch your left hand overhead and across as the right hand reaches for the deployment handle.
   4. Activate (pull or throw) the handle vigorously, returning to the original position.
   5. Verbalize each action, e.g., “Arch! Reach! Pull!”
   6. After activation:
      a. Remain flat, stable, and shoulders-level through deployment, counting to three by thousands.
      b. After the count of three, visually check for pilot chute deployment.

D. CANOPY SKILLS
   1. Steering the canopy
      a. With both toggles all the way up, the canopy glides ahead at full speed.
      b. The canopy turns right when you pull the right toggle (steering control line handle) down and turns left when you pull the left toggle down.
      c. The canopy will turn as long as one toggle is held down and stops when it is let up.
      d. Turning the canopy causes it to dive, which can have serious consequences near the ground.
      e. With both toggles all the way up, the canopy should fly straight.
      f. Stop all turns in time to prepare for landing.
      g. To prevent a collision with another jumper, always look first in the direction of the intended turn.
   2. Canopy speed and wind
      a. If open over a point upwind of the target, as is routine, the canopy can fly toward the target faster than it can fly away.
      b. The effect becomes more pronounced in stronger winds.
      c. Until entering the landing pattern, remain upwind of the 1,000-foot point.

The square pattern shown to represent the concept would be the correct shape for a calm day. On days with a light breeze, it will become elongated and more narrow (addressed in Category C).

3. Landing pattern strategy
   a. Each jumper has a responsibility to himself and others to land in a clear area.
   b. Fly to specific, pre-assigned points above the ground, near the landing target area (or a clear alternate area), typically in a rectangular pattern.
      (1) Fly a straight line against the direction of the wind from a pre-assigned point 300 feet high until touchdown, steering away from any dangerous obstacles.
      (2) To reach that 300-foot point, fly crosswind from a pre-assigned point perpendicular to the final approach leg, 600 feet above the ground (base leg).
      (3) To reach the pre-assigned point at 600 feet high, begin the landing pattern by flying downwind from a pre-assigned point 1,000 feet over the ground to one side and even with or slightly upwind of the target.
         (i) If arriving too low at the planned 600-foot ground point, cut the corner to final approach.
         (ii) If arriving too high at the planned 600-foot ground point, correct by looping out during the base leg on the way to the 300-foot point.

Note: The USPA Instructor may need to adjust the shape of the pattern or the checkpoint altitudes to account for various circumstances.
4. Descent strategy from opening to 1,000 feet
   a. After checking for a good parachute canopy, mark the opening point directly below and check the altitude.
   b. Draw an imaginary line from the actual opening point to the pre-assigned pattern entry point at 1,000 feet and divide the line according to the remaining altitude.
   c. Stay over the correct portion of the line until reaching the appropriate altitude to fly to the next portion.
   d. For example:
      (1) Open with a good canopy by 4,000 feet.
      (2) Fly over the first third of the line until 3,000 feet.
      (3) Fly over the second third of the line until 2,000 feet.
      (4) Fly to the pattern entry point by 1,000 feet.
   e. If over the pre-assigned 1,000-foot ground check-point higher than 1,000 feet, steer back toward the opening point momentarily and return at the correct altitude of 1,000 feet.

5. Alternate landing strategy
   a. You need to be halfway back to the field with no less than half the altitude remaining or pick an alternate open landing area.

b. If at 2,000 feet or higher (decision time), it’s obvious that the 1,000-foot point is unreachable:
   (1) Select an open area free of obstacles nearby in which to land.
   (2) Visually transfer the intended landing pattern to the new landing area.
   (3) Fly the new landing pattern.

c. Jumpers landing away from the planned landing area may have to make their own correct decisions to land in a safe area.

6. Final approach strategy
   a. Steer into (against) the wind throughout final approach (heading within 60 degrees of the wind with assistance recommended to complete Category A).
   b. Just before landing, convert the forward speed of the parachute to lift by flaring.
      (1) On the large canopies most beginners use, depress the toggles through a full stroke to flare.
      (2) Most canopies land best when the jumper initiates the flare at ten to 15 feet above the ground, but the exact altitude is often difficult to judge at first.
   c. Once the flared canopy has finished its swoop, the canopy stalls and will begin to drop gently at first and then more quickly.
      (1) You should probably keep the toggles in the flare position; pulling them farther may increase the descent rate.
      (2) Letting the toggles up abruptly causes a steep dive.
      (3) Easing the toggles up slightly may improve the landing but only if the canopy was stalled very high.
   d. Fly straight, preferably into the wind.
   e. Beginners should jump oversized canopies that stall gently and allow for errors.

7. Perception of speed
   a. The canopy seems to fly very slowly until you get lower on final approach.
   b. You may notice the speed for the first time at this point, which may trick you into flaring early.
   c. The canopy needs speed to get an effective flare.
   d. Wait until the correct altitude to flare.

E. LANDING TRAINING

1. Parachutists absorb the shock of a hard landing with a parachute landing fall (PLF) taught as part of the first-jump course for all students making solo descents.
   a. To prepare for the landing, press your feet and knees together with your knees slightly bent and flexed to absorb the initial shock of the landing.
   b. Flare the canopy with both hands together and close to the front of your body to help prevent wrist and hand injuries.
c. Chin to the chest to help prevent neck injuries.
d. Upon contact:
   (1) Maintain the preparation position as much as possible throughout the ensuing landing roll.
   (2) Lean into the direction of the landing to roll down one side of the body.
   (3) Contact feet first, then—
      (i) Lay over to the side of one calf.
      (ii) Continue to roll to the thigh on the same side.
      (iii) Contact with that hip (side of the butt).
      (iv) Roll diagonally across your back to the opposite shoulder.
      (v) Throw your legs overhead, if necessary.

F. LANDING PROBLEMS (AT TRAINING HARNESS)

**POWER LINES**

1. Power lines typically appear along roads and paths and between buildings.
2. They may be invisible, except for their poles.
3. Power lines can be extremely dangerous, but also avoid equally dangerous sharp turns low to the ground.
4. Procedure for landing in a power line:
   a. Drop any ripcords.
   b. Pull both toggles to the halfway position, prepare for a hard landing, and turn your head to one side. (With a round reserve canopy, place your hands between the front and rear risers on each side.)
   c. Touch no more than one wire at a time.
   d. If suspended in the wires: The parachute can conduct electricity, so the power needs to be off before making contact with anyone on the ground.

**WATER**

1. Refer to the USPA BSRs for equipment requirements on jumps near water, but many drop zones have waivers on file.
2. Procedure for an unintentional water landing:
   a. Inflate the flotation device (if available).
   b. Disconnect the chest strap.
   c. Steer into the wind.
   d. Enter the water with lungs full of air.
   e. Prepare for a PLF; since the depth is unknown.
   f. Dive deep and swim out from under the collapsed canopy.
   g. Take a deep, full breath at every opportunity.
   h. Release or slide off the leg straps and swim carefully away to avoid entangling in the suspension lines.

**TREES**

1. Most tree landings are survivable, but accidents may also occur during the recovery.
2. Continue steering to avoid trees but avoid sharp turns near the ground.
3. Procedures for landing in a tree:
   a. Before landing, steer into the wind.
   b. Flare to half brakes.
   c. Keep your legs tight together, but not crossed.
   d. Protect your face with both hands and forearms, with both elbows tightly together and close to your stomach.
   e. Try for the middle of the tree, then hold on to the trunk or main branch to avoid falling.
   f. Prepare for a hard landing on the ground after falling through the tree.

**BUILDINGS**

1. A jumper could land into the side of a building or on top of it.
2. Make slight steering corrections to avoid the building or object, but stop any turns in time to prepare to land.
3. Procedures for landing in or on a building:
   a. Prepare for a hard landing (PLF position).
   b. Strike the object feet first.
   c. If on top of a building in windy conditions, activate the main canopy release system to prevent being dragged off the building.
any obstacle landing

1. Remain still and keep your helmet on.
2. Prepare to drop the rest of the way to the ground at any moment.
3. Wait for competent, knowledgeable help (drop zone staff) for help in getting down.

landing off field

1. Steer for a clear area
2. Transfer the planned landing pattern to the new, clear area.
3. Look for and avoid obstacles.
4. Perform a parachute landing fall.
5. Wait for assistance or further instructions.
6. Be polite to property owners.

recovering the canopy in higher winds

1. Land using a parachute landing fall.
2. Get up quickly and attempt to run toward the canopy until it collapses.
3. Pull in one toggle and steering line to assist in collapsing the canopy (especially if being dragged).
4. Cut away the canopy as a last resort or if injured, but wait for assistance before walking anywhere.

round canopy (reserve use only)

1. Round canopies have vents in the rear to enable forward speed (less than ten mph).
2. Steer the canopy using the back risers, or if rigged on two risers only, the steering lines.
3. Steer across or with the direction of the wind toward a clear area.
4. Steer into the wind at 200-300 feet before landing and continue steering to avoid obstacles.
5. Prepare to land using the PLF.

G. Equipment Problems (at Training Harness)

1. For a parachute to be safe to land it must be:
   a. “There,” meaning deployment has occurred and something is overhead.
   b. “Square,” meaning that the parachute is inflated, rectangular (or slightly tapered), and regular in shape.
   c. “Steerable,” meaning that you can control heading and flare.
   d. In the event of a toggle malfunction, the rear risers may be used for steering and flaring the canopy.
2. If the parachute fails any of the above tests, you must initiate reserve parachute procedures.
3. Decide if the parachute is controllable and ready to land by 2,500 feet; otherwise, execute the planned emergency procedures.
4. Routine problems in order of correction:
   a. To find a missing deployment handle, first find its location on the system (two additional tries).
      (1) For bottom of container location, feel across the bottom of the back pack to the corner; then down the side to the corner, then go to reserve.
      (2) For ripcord handle mounting on the harness, locate that part of the harness or harness intersection; if that fails after two tries, go to reserve.
   b. For a stuck main deployment handle, try again twice with both hands, if possible, then deploy the reserve.
   c. To clear a pilot chute hesitation (burble), twist at the waist to change the airflow.
   d. To untwist the lines, spread the risers and kick.
   e. To bring down a stuck slider, depress the toggles to the flare position and pump them.
   f. To open the end cells, depress the toggles to the flare position and hold them.
   g. If the canopy has opened normally but turns on its own, be sure both brakes are released.
   h. Broken lines, rips, other canopy damage, or pilot chute entangled in the lines: Determine by 2,500 feet whether the canopy is steerable and flares without problems.

H. Equipment Emergency Procedures

total malfunction

Note: Some schools teach partial malfunction procedures when the parachute has been activated but has failed to deploy.

1. Return to the arch position.
2. Ripcord systems only: Discard the main ripcord if extracted.
3. Look for and locate the reserve ripcord handle.
4. Pull it all the way out to activate the reserve parachute.
5. Arch and check over the right shoulder for reserve pilot chute deployment.

partial malfunction

Note: On single-operation systems, pulling the reserve ripcord releases the main canopy first before deploying the reserve. Partial malfunction procedures for a single-operation system (SOS) are the same as for a total malfunction.

1. Check altitude.
2. Return to the arch position.
3. Ripcord systems only: Discard the main ripcord.
4. Locate and grasp the cutaway handle.
5. Locate the reserve ripcord handle.
6. Pull the cutaway handle until no lower than 1,000 feet.
7. Pull the reserve ripcord handle immediately after cutting away or by 1,000 feet, regardless of stability, to initiate reserve deployment.
8. Arch and check over the right shoulder for reserve pilot chute deployment.
9. Do not cut away below 1,000 feet.
   a. If a malfunction procedure has not resolved the problem by then, deploy the reserve (requires a cutaway with an SOS system).
   b. In the event of any malfunction and regardless of the planned procedure or equipment, the reserve ripcord must be pulled by no lower than 1,000 feet.

other unusual situations

1. Premature container opening in freefall (hand deployment only):
   a. Attempt to locate and deploy the pilot chute first (no more than two attempts or two seconds, whichever comes first).
   b. If the pilot chute can’t be located after two tries or if deploying the pilot chute results in a partial malfunction, cut away and deploy the reserve.
2. Both parachutes deployed:
   a. Biplane
      (1) Do not cut away.
      (2) Steer the front canopy gently using toggles.
      (3) Leave the brakes stowed on the back canopy.
      (4) Make a parachute landing fall on landing.
   b. Side-by-side
      (1) Steer the dominant (larger) canopy gently using toggles.
      (2) Leave the brakes stowed on the other canopy.
      (3) Make a parachute landing fall on landing.
   c. Downplane: Cut away the main canopy.
3. Canopy collision:
   a. Jumpers must avoid collisions with other jumpers under open parachutes.
   b. If a collision is imminent, in most cases both jumpers should steer to the right.
   c. If two jumpers collide and entangle, they must communicate their intentions before taking further action.
   d. If it is too low for a safe cutaway (below 1,000 feet) and the canopies are uncontrollable, both jumpers should deploy their reserves.

Note: Deploying the reserve on a single-operation system necessitates a cutaway.

premature deployment in aircraft

1. The student should attempt to contain the open parachute and inform the instructor.
2. If the parachute goes out the door, the student must follow immediately before being extracted.
II. SOLO: METHOD-SPECIFIC SECTION

Note: This section must be taught by either a USPA Instructor or Instructor Examiner rated for the method-specific discipline in which the student is being trained.

A. AIRCRAFT PROCEDURES

1. Approach, enter, and move about the aircraft, engine running or not, only when accompanied by your instructor.
2. To avoid contact with the propeller, always approach fixed-wing aircraft from the rear.
3. Be mindful of the size of the equipment when climbing into and moving about the aircraft.
4. The pilot and the jumper are jointly responsible that seat belts are worn during taxi, takeoff, and landing (see the FARs on seat belt use).
5. Climbout and exit procedures prepare you to meet the relative wind in a stable, belly-first freefall body position.
   a. Into position or climbout: Move into position using practiced steps for efficient placement in the door (larger plane) or on the wing strut (Cessna, etc.).
   b. Set-up: The pre-launch position should place your belly (pelvis) into the relative wind as part of the launch from the plane.
6. Count or “go” command
   a. AFF students: Verify that the instructors are ready.
      (1) Call “Check in!” to the inside instructor, who responds, “OK!”
      (2) Call “Check out!” to the outside instructor, who responds, “OK!”
      (3) Take a breath to relax and then begin a verbal and physical cadence of three (“Up, down, arch!” or “Out, in, arch!” etc.) to help the instructors leave simultaneously with you.
   b. Static-line or IAD students: Climb into position and wait for the instructor’s command.
      (1) Look for corrective signals from your instructor (examples in SIM Appendix A).
      (2) On “Go!” take a breath to relax and look up.
      (3) Release from the plane, count out loud by thousands to five-thousand, then check the parachute.
   c. You must exit soon after climbout to ensure that you open over the correct point.

B. EXIT PRESENTATION

1. Upon release from the plane, move efficiently into the flying position to reduce unwanted momentum.
2. Present the correct belly-to-wind position: hips to the wind, head back, legs extended, and hold.
3. Head-high presentation to the relative wind helps you remain oriented; however, you might also exit sideways or head down in relation to the horizon while remaining stable, belly first, on the relative wind.

C. EXIT PROBLEMS

1. Special considerations for AFF exits:
   a. In case of instability, (in order)—
      (1) arch until the horizon comes flat into view
      (2) read the altimeter
      (3) establish communication with the instructors (examples of signals in SIM Appendix A)
   b. Continue as usual in the event of the loss of one instructor.
   c. If both instructors become unavailable at any time during the freefall, initiate deployment immediately.
2. Special considerations for static-line exits:
   a. Arch to regain lost stability on exit.
   b. If the static line fails to disconnect from the parachute system and you are being towed behind the aircraft, (in order)—
      (1) Remain arched and use a pre-determined signal to communicate recognition of the problem.
      (2) Wait for the instructor to cut the static line.
      (3) After falling free, deploy the reserve.

D. AIRCRAFT EMERGENCIES

1. Rough landing procedures:
   a. helmet and seat belt on
   b. knees to chest
   c. hands clasped behind head to reinforce neck
   d. immediate but orderly egress on landing
   e. Jumpers exiting a wrecked aircraft should go immediately to the nearest exit, touch nothing on the aircraft, and walk at least 100 feet away from the plane.
2. In the event of a problem during flight, the instructor will help prepare you for one of four actions:
   a. All land with the aircraft.
   b. Exit and deploy the reserve parachute.
   c. Exit and deploy the main parachute (passive deployment for static-line and IAD).
   d. Perform a routine exit with or without instructor assistance.
3. After an emergency exit and once under an open canopy:
   a. Look for the instructor’s parachute and follow it to a clear, open landing area.
   b. Select any clear area if an instructor can’t be found.
III. AFF Procedures

Note: This section must be taught by either a USPA AFF Instructor or Instructor Examiner.

A. Freefall Procedures

1. After exit, take a breath and relax into the correct freefall position.
2. Perform a “circle-of-awareness” check:
   a. Look at the ground about 45 degrees ahead and below.
   b. Read the altimeter.
   c. Look at the reserve-side instructor and receive an acknowledgement or any communication (corrective signals).
   d. Look at the main-side instructor and receive an acknowledgement or any communication (corrective signals, see SIM Appendix A).
3. Perform three practice deployments.
   a. Practice slowly and deliberately.
   b. Verbalize each action, e.g., “Arch, reach, touch!”
   c. Pause to feel the deployment handle each time.
   d. Reinforce the correct body position before, during, and after each practice deployment.
4. Perform a second circle-of-awareness check.
5. Monitor altitude and body position for the remainder of the freefall.
   a. Altitude (most important)
   b. Arch (hips forward)
   c. Legs (check leg position and probably extend them slightly)
   d. Relax (breathe)
6. Video camera flyer
   a. The distraction of a video camera flyer may cause you to lose track of altitude; you must pay extra attention.
   b. The benefit of video is recognized for all training jumps.
7. At 5,500 feet, initiate deployment procedures:
   a. Signal deployment to instructors by waving both arms overhead.
   b. Deploy the parachute exactly as practiced.
   c. The instructor may assist with activation and deployment, as necessary.
   d. Maintain altitude awareness and attempt deployment within 1,000 feet of the planned altitude (4,500 feet recommended) to complete Category A.

B. After Deployment

1. Look for traffic.
2. Take an initial direction based on what the instructors’ canopies are doing below.
3. If lost or off course, follow the instructors to a safe landing area or steer to any clear area for landing.

IV. Tandem Procedures

Note: This section must be taught by either a USPA Tandem Instructor or Instructor Examiner.

A. Tandem Training Strategies

1. Not all schools train students to complete Category A on the first tandem jump, and not all students desire it.
2. Much of the instruction on the tandem first jump may take place during the jump itself.

B. Minimum Tandem Course

1. Before boarding the aircraft, you should be briefed how to (also refer to FAR 105.45.a.2.i)—
   a. Check the four points of attachment to the instructor’s harness
   b. Place both hands in the safety position
   c. Establishing an arch on exit
   d. Maintain a stable freefall position
   e. Read the altimeter
   f. Operate the drogue release handle by 4,000 feet
   g. Establish the position to prepare for a cutaway
   h. Prepare for landing
2. Ground instruction must be conducted before boarding and be sufficient to prepare you for a safe tandem jump.

C. Category A via Tandem Jumping

1. Category A freefall position, main deployment, canopy skills, training and advancement criteria are the same as for solo students.
2. PLF landing training, solo equipment orientation, equipment malfunctions, and all method specific training is to be completed during Category B.
3. Since the minimum drogue release altitude for tandem jumps is 4,500 feet (BSRs), tandem students should begin deployment procedures by at least 6,000 feet to safely meet the advancement criterion for attempted deployment within 1,000 feet.
4. Most of the Category A training can be conducted as the jump progresses.
5. Special training notes:
   a. Freefall position: On at least the first tandem jump, your hands should remain in the safety position on the front of the student’s harness at all times until otherwise directed by the tandem instructor.
   b. Deployment: in terms of a solo rig.
   c. Climbout and exit:
      (1) The instructor will teach you to exit that best exit presents the tandem pair face-first into the relative wind.
      (2) The instructor verifies that you are ready, and then begins a cadence of three (“Ready, set, go!” “Up, down arch!” etc.) to help you anticipate the exit and prepare for solo freefall.
d. equipment:
   (1) In Category A, the tandem instructor takes responsibility for correctly putting on and adjusting your equipment and protecting the operation handles during pre-jump operations.
   (2) Before moving into exit position at the jump door, you must verify the harness attachment in two places at the shoulders and two places near the hips.

e. freefall procedures
   (1) After exit, take a breath and relax into the correct freefall position.
   (2) Look for signals from the instructor (SIM Appendix A) or listen for verbal corrections.
   (3) If you exited with both hands in the safety position, the instructor may signal for moving them into the freefall position.
   (4) Once in freefall, perform according to the Category A dive flow for tandem students.

f. Canopy flight procedures are the same as the canopy dive flow for solo students.

g. landing
   (1) You’ll prepare for routine landings with a technique specific to tandem jumping for that day’s conditions.
   (2) A severe situation requires a parachute landing fall (PLF), which the instructor can teach on the ground or while under canopy in the event of a problem.
   (3) Ordinarily, you’ll learn the PLF during transition training to solo freefall (first-jump course).

h. winds
   (1) Jumps that have canopy training as a primary goal should be conducted within the BSR wind limits for student jumps.
   (2) The instructor may need to provide additional training to prepare you for landing a tandem parachute in higher winds.
CATEGORY A FREEFALL DIVE FLOWS

AFF
• Exit in a relaxed arch.
• Instructors release arm grips.
• Circle of awareness.
• Three practice deployments.
• Circle of Awareness.
• Altitude, arch, legs, relax.
• Begin wave off at 5,500 feet.
• Pull by 4,500 feet.

IAD and Static Line
• Check deployment device prior to climb-out.
• Climb out.
• Exit on command with legs extended.
• Count aloud to five by thousands.
• Check canopy.

Tandem
(to meet Category A tandem training objectives)
• Exit with arms in safety position.
• On instructor’s signal, relax into neutral arch.
• Check altitude.
• Three practice deployments.
• Altitude, arch, legs, relax.
• Begin wave off by 6,000 feet.
• Pull by 5,500 feet.

CATEGORY A CANOPY DIVE FLOW
(also used for tandem students training to meet Category A objectives)
• Release brakes and fix routine opening problems.
• Look left, turn left.
• Look right, turn right.
• Flare.
• Determine position and altitude.
• Find landing area and pattern entry point.
• Steer over correct portion of flight path until 1,000 feet.
• Follow pre-assigned pattern over landing area.
• Flare to land and PLF (solo students).

CATEGORY A INSTRUCTOR NOTES:
• Budget training time to cover only the most important topics.
• To reduce student workload and training effort, employ staff support as much as possible, including assistance after landing.
• The instructor is responsible for putting the student’s equipment on, adjusting it, and performing all equipment checks; students make sure checks are performed.
• The instructor closely supervises the student when approaching, boarding, and being seated in the aircraft, including providing instruction on seat belt use during seating.
• The instructor directs the student on the correct action in the event of any aircraft emergency (except in the event of the student’s parachute deploying out the door).
category a quiz

Administered orally after completing the jumps in this category.

1. Describe how to avoid the propeller(s) when approaching an aircraft. [Approach fixed-wing aircraft from the rear. (FJC outline)]

2. Who is responsible for seat belt use in the aircraft? [pilot and jumper (FAR 91.107.A.1 through .3)]

3. When must seat belts be fastened? [movement on the surface (taxi), takeoff, and landing (FAR 91.107.A.2)]

4. From whom do you take directions in the event of an aircraft problem? [my instructor (FJC outline)]

5. What is the purpose of the count (command to jump for static line) on exit? [helps AFF student and instructors to leave at the same time; static line students to leave at the right place over the ground (FJC outline)]

6. Where does the wind come from initially upon exit from the aircraft? [direction of flight (FJC outline)]

7. Why do skydivers first learn to fall stable face to earth (think in terms of the equipment)? [best position for deployment (FJC outline)]

8. What does a canopy do immediately following a turn? [dives (FJC outline)]

9. What is each jumper’s greatest responsibility once under canopy? [to find a clear area for landing (FJC outline)]

10. What is the purpose of the landing flare? [Convert forward speed to lift at the first point of touchdown. (FJC outline)]

11. Describe the procedure for a hard landing (parachute landing fall or PLF). [Student should demonstrate: feet and knees together, hands and elbows in, roll on landing. (FJC outline)]

Note: Tandem students: The PLF is the correct landing procedure for solo jumps.
In the early Categories, like a magic mantra, you’ll hear over and over again from your instructors: “Altitude, arch, legs, relax.” Managing all four points at once is the key to controlled freefall.

After altitude awareness, relaxing is your key goal. It takes only a little push from the hips to get an effective arch, and you usually need to extend your legs only a little to get use of them in the wind. But you need to relax your other muscles a lot.

So how can a brand-new skydiver relax in such an adrenaline-charged, exciting, and new environment?

Sports psychologists all recognize the value of staying loose and mentally relaxed for peak performance. Many describe ways to achieve a state of prepared relaxation. Each athlete learns to develop one technique and uses it to gain that state before and sometimes during every performance.

Almost all the techniques begin with slower, deeper, controlled breathing. Learn to breathe from deep in your lungs, using the muscles of your diaphragm. Practice breathing in slowly until your lungs are full and then emptying your lungs completely when you breathe out.

While you practice controlled breathing, you can use one of several suggested devices to relax your mind and your body:

- Imagine yourself in a familiar, comfortable place, trying to visualize every sensual experience that you can associate with it: sight, sound, odor, taste, and touch. Picture the colors of the background and the details, try to smell the air as it would be, imagine you hear the sounds, and feel the air on your face. Imagine you just took a sip of your favorite drink.
- Relax your body part by part, starting with your toes, then your ankles, calves, thighs, hips, abdomen, etc., spending five to ten seconds in each place while continuing your controlled breathing.
- Count up to ten with each breath and then backward to zero.

There are many other relaxation techniques you can borrow or develop, but choose one and practice it until you perfect it, even when you’re not skydiving. That way, you can relax yourself quickly and effectively whenever the need arises—such as just before a skydive.

You should continue controlling your breathing as you’re getting ready to jump. Move slowly and deliberately in the aircraft as you approach the door and get into position, not only for safety but to help you maintain your relaxed, prepared state for the jump. Take another breath just before you actually launch from the aircraft and again to help you settle into freefall as soon as you let go. Make breathing part of every sequence, especially as you go through your “altitude, arch, legs, relax” sequence.

While skydiving is inherently a high-speed sport, you’ll notice that the best skydivers never do anything in a hurry.
CATEGORY B—INTRODUCTION

In Category B, you learn to become more comfortable in the skydiving environment.

• AFF and tandem students perform leg awareness exercises to improve control.
• Static-line and IAD students get introduced to the self-deployment device and practice mock deployments after exit.
• Tandem students take a more active role in the exit, leading the count and presenting their bodies correctly to the wind. Each tandem student should hold a correct body position until establishing stability and then maintain it throughout the freefall.

Training in this category reviews and expands your understanding of the canopy landing pattern and the airport environment, with attention to avoiding aircraft on or approaching the runways. You help with pre-flight planning and the use of the written flight plan, including opening point, the projected wind line, and the landing pattern. Also, you learn to use the runway as a reference for direction and distance when observing the drop zone from the aircraft or under canopy.

For AFF, IAD, and static-line students, emergency review emphasizes topics from the first-jump course on parachute malfunctions. Tandem students will also learn and practice parachute malfunction procedures before advancing from this category to solo freefall.

In Category B, you become more responsible for your equipment, particularly while moving around and inside the aircraft. Study topics introduce USPA Basic Safety Requirements for student jumps.

To advance, AFF and tandem students should monitor altitude and deploy at the correct altitude without prompting from the instructor. IAD and static-line students must complete three successive, stable practice deployments.

Instructor: Transition Protocol

Crossover students to harness hold who have completed Category A in the tandem program must complete the harness-hold first-jump course before making AFF jumps in Category B.

Crossover students to AFF who have completed Category A in the IAD or static-line program will need additional training on the climbout, set-up, and count; AFF freefall communications; use of the altimeter in freefall; and use of the main parachute deployment device, including deployment device malfunctions.

Crossover students to tandem who have completed Category A in the solo jumping programs will need to complete any additional required paperwork and understand their responsibility to check the tandem system hook-ups before exit, as well as any special landing procedures.

Crossover students to IAD or static line who have completed Category A in another solo training method will need training in their main deployment system and its specific emergency procedures.

Category A students crossing over to IAD or static-line from the tandem program will need to complete the solo first-jump course before making IAD or static-line jumps in Category B.
EXIT AND FREEFALL

AFF AND TANDEM
STUDENTS
• stability within ten seconds of exiting the aircraft
• maintain correct body position for stability throughout, including leg awareness and control
• initiate deployment procedures within 500 feet of the assigned altitude
• in addition, tandem students complete the solo first-jump course

STATIC-LINE AND IAD STUDENTS
• three successive exits with stable practice deployments within five seconds of exit

CANOPY
• understanding and planning descent strategy from opening to pattern entry and pattern principles
• steering with clearance procedures without prompting (self-evaluated)
• assisted flare for a safe landing within 30 degrees of heading into the wind

EQUIPMENT
• understanding routine canopy problems and the correct responses

ORAL QUIZ

• read and discuss SIM Section 2-1.E for student training, jumps, and supervision requirements
• read and discuss the USPA recommendations on parachute malfunctions and procedures, SIM Section 5-1.A through .E
• study the illustration in FAA Advisory Circular 90-66, Appendix 3, in SIM Section 9-2

*Note: For reasons of safety, AFF, static line, or IAD students who do not complete the flaring and landing advancement criteria in Category B should be recommended for tandem or other comprehensive canopy training. If all other Category B advancement criteria have been met, the student may satisfy Category B canopy skills in another discipline and then advance to Category C in the preferred discipline.
A. EXIT AND FREEFALL

1. Student-led exit (all students)
   a. Review the exit set-up from Category A.
   b. IAD and static-line students perform the climbout with little or no assistance from the instructor and exit promptly on the “Go!” command.
   c. Tandem students climb into position after the instructor’s OK, check with the instructor once in position, and initiate the exit count.

2. Altitude awareness to recognize and act at the assigned pull altitude is the most important task in freefall.

3. “Altitude, arch, legs, relax:” Repeat to establish and maintain awareness, stability, and control.
   a. Know your altitude (static line students know their exit altitude and count to keep track of time after release from the aircraft).
   b. Check your arch (hips forward a little).
   c. Check your legs (most beginners need to extend their legs a little and point their toes).
   d. Relax
      (1) Breathe consciously to release tension.
      (2) Use this technique just before and after releasing from the aircraft.

4. Deployment
   a. AFF and tandem students
      (1) Practice deployment in freefall until comfortable with locating the deployment handle.
      (2) Wave-off to signal deployment.
      (3) Pull at the correct altitude without prompting from the instructor to complete Category B.
   b. IAD and static-line students practice deployment within five seconds of exit (three successful jumps in a row required before solo freefall).

5. Leg awareness
   a. AFF and tandem students practice leg awareness by extending legs for forward motion.
      (1) Extending the legs from the neutral position adds more drag in the back, lifting your lower body.
      (2) The off-level attitude causes you to slide forward on the deflected air (the effect is less noticeable in tandem droguefall).

   (3) Hold the position for three seconds and return to neutral to cancel the effect.
   (4) Finish all maneuvers 1,000 feet above wave-off altitude or 6,000 feet, whichever comes first.

b. IAD and static-line students increase leg awareness during the exit set-up and after release from the plane.

6. Maintaining a heading
   a. First, relax into a comfortable, relaxed, neutral body position.
   b. Find a point ahead on the horizon as a heading reference.
   c. If turns are performed (AFF and tandem):
      Note: Although not required, team turns—like relaxation—may aid a student in preventing turns on later jumps.
      (1) The instructor(s) turn the student 45-90 degrees.
      (2) The student turns back to the original heading.
      (3) Check the altitude.
      (4) Repeat in the opposite direction (if time).

B. CANOPY

1. Look first in the direction of a turn under canopy.
2. Using a DZ photo or taking a walk in the field, you’ll preview with an instructor the expected opening point and prepare a written flight plan together.
3. Review the descent strategy:
   a. Determine position and altitude upon opening.
   b. Locate the target and establish a line to the pre-planned 1,000-foot pattern entry point.
   c. Divide the line logically according to the remaining altitude (halfway down, halfway back); for example, if open at 4,000 feet—
      (1) Divide the line in thirds and fly over the first third until 3,000 feet.
      (2) Fly over the second third until 2,000 feet.
      (3) Fly over the remaining third until reaching the pre-planned pattern entry point at 1,000 feet.
   4. Fly to the instructor-assigned pattern entry at 1,000 feet, identified on the written flight plan.
5. Fly the pre-planned pattern for no wind or light winds—downwind, base, and final approach legs, using specific points to overfly at specified altitudes.
6. Fly a straight-in final approach without S-turns (S-turns present a hazard to other traffic).
7. Flare at 10-15 feet, based on Category A experience. Note: Flaring is covered in more detail in Categories C and F.
8. Review the PLF and its value to protect against a hard landing.

C. EMERGENCY PROCEDURE REVIEW

Note: After completing the solo first-jump course, tandem students should review this section each day before making any jump in Category C. This section also serves as a review outline for any jumper undergoing general review following a period of inactivity.

1. Deploy at the correct altitude, regardless of stability.
2. Review common problems at the training harness (tandem students may review while under canopy):
   a. correct response to line twist:
      (1) Spread the risers and kick to untwist.
      (2) If spinning, twist the risers to untwist the lines and stabilize canopy, then kick to untwist the risers.
      (3) By 2,500 feet, be sure line twist can be corrected at a safe altitude, or initiate emergency procedures.
   b. slider up:
      (1) Bring both toggles to the bottom of the stroke to slow the canopy and pump at the bottom of the control range.
      (2) Alternatively, pump the back risers.
      (3) The slider needs to be at least halfway down for landing.
      (4) Repeat remedial procedures twice or until reaching the decide-and-act altitude of 2,500 feet.
   c. end-cell closure:
      (1) Pull both toggles to the bottom of the stroke and hold them until the end cells open, then release them smoothly.
      (2) Alternatively, hold down both back risers.
      (3) If the end cells can't be cleared, evaluate controllability and flare before reaching the cutaway decide-and-act altitude of 2,500 feet.
   d. If the canopy has opened normally but turns on its own, be sure both brakes are released.
   e. Evaluate controllability and flare before reaching the decide-and-act altitude of 2,500 feet for:
      (1) Broken steering line: Use back risers.
      (2) Broken suspension line(s): More than four broken lines should result in a decision to initiate reserve procedures.
      (3) Pilot chute entangles with canopy or lines.
      (4) Damage: Canopy rips or tears.
   f. Review deployment problems for manual activation (introduction for IAD and static-line students).

   a. Make only two attempts to correct the problem before initiating reserve procedures.
   b. lost deployment handle:
      (1) Hip or chest handle location: Follow harness webbing for two seconds only.
      (2) Bottom of container location: Sweep bottom of container, then side of container to corner for two seconds only.
   c. hard pull:
      (1) Hip or chest handle location: Try again with two hands.
      (2) Bottom of container: Place elbow against container for leverage.
   d. pilot chute hesitation:
      (1) Twist while looking over the right shoulder to modify the airflow.
      (2) Repeat over the left shoulder.
   e. Review deployment (in tow) problems for static-line equipment: The student signals to the instructor his or her readiness to deploy the reserve once the static line is disengaged.
   f. Practice for recognizing and responding to total and partial malfunctions (from Category A procedures).
   g. Review minimum cutaway altitude and reserve deployment without cutaway if necessary.
      a. Decide to cut away by 2,500 feet and act.
      b. If below 1,000 feet without a functioning canopy, deploy the reserve (will result in a cutaway on an SOS system).
      c. If in a canopy entanglement with another jumper below 1,000 feet and it appears the canopies cannot be separated in time for a safe landing, deploy the reserve (will result in a cutaway with the SOS system, so may not be an option).
      d. Both parachutes deployed:
         (1) Biplane—do not cut away, steer the front canopy gently using toggles; leave the brakes stowed on the back canopy; PLF.
         (2) Side-by-side—steer the dominant (larger or more overhead) canopy gently using toggles; leave the brakes stowed on the other canopy; PLF.
         (3) Downplane—cut away the main canopy.
      e. Premature deployment in aircraft:
         (1) Attempt to contain the open parachute and inform the instructor.
         (2) If the parachute goes out the door, follow it immediately, before being extracted.
D. Equipment

1. Parachute deployment with opportunities for malfunctions explained (actual deployment on the ground recommended)—
   a. lost or unrecoverable deployment handle
   b. impossible deployment handle extraction
   c. pack closure
   d. pilot chute entanglement
   e. pilot chute hesitation
   f. pilot chute in tow
   g. horseshoe
   h. bag lock
   i. streamer
   j. line-over
   k. fabric or line failure sufficient to interfere with control and flare
   l. slider hang-up
   m. control-line entanglement

2. Review parachute retrieval after landing.

E. Rules and Recommendations

1. Review the USPA Basic Safety Requirements (BSRs) on supervision and progression requirements for students
2. Review the BSRs on wind limits for students (waiverable by a USPA Safety & Training Advisor).
3. Review the BSRs on minimum required deployment altitudes for students and USPA A license holders.
4. Review the BSRs on drop zone requirements for students and what is considered a landing hazard.

F. Spotting and Aircraft

1. Minimum, careful movement in the aircraft helps prevent premature activation.
2. Runway lengths and headings (use of a compass)
   a. The runway heading provides a reference for direction (north, south, east, and west).
   b. The runway length provides a reference for judging distance from the air (in tenths of a mile for GPS and Loran).
3. Winds are described by their direction of origin, said as a compass heading (for example, “The winds are two-seventy,” means the winds are blowing from the west).
4. Avoid runways and approaches, including getting clear of a runway after landing on or near one.
5. Discuss local aircraft traffic approach altitudes and landing patterns and their relationship to canopy approach and landing patterns. (See the illustration below, and also refer to the illustration in FAA Advisory Circular 90-66, Appendix 3, in SIM Section 9-2.)
6. Crossing the runway
   a. Know the airport and drop zone rules about crossing a runway.
   b. If allowed, look both ways and minimize the time spent on the runway.
**CATEGORY B FREEFALL DIVE FLOWS**

**AFF**
- Exit in a relaxed arch.
- Instructors release arm grips.
- Circle of Awareness.
- Practice deployments until comfortable.
- Altitude, arch, legs, relax.
- Extend legs for three seconds and hold.
- Altitude, arch, legs, relax.
- Repeat as altitude permits.
- Team turns (if trained).
- Begin wave off at 5,500 feet.
- Pull by 4,500 feet.

**IAD and Static Line**
- Check deployment device prior to climbout.
- Climb out.
- Exit on command with legs extended.
- Practice deployment with count to track time.
- Check canopy.

**Tandem**
- Initiate count after instructor’s OK.
- Exit in a relaxed arch.
- Altitude, arch, legs, relax.
- Practice deployment until comfortable.
- Extend legs and hold for three seconds.
- Altitude, arch, legs, relax.
- Repeat as altitude permits.
- Turns (if trained).
- Begin wave-off by 6,000 feet.
- Pull by 5,500 feet.

**CATEGORY B CANOPY DIVE FLOW**
- Release brakes and correct routine problems.
- Look left, turn left.
- Look right, turn right.
- Flare.
- Determine position and altitude.
- Find landing area and pattern entry point.
- Divide flight path by thousands of feet.
- Instructor explains minor canopy problems and remedies (tandem only).
- Look at runway and determine compass heading.
- Steer over correct portion of flight path until 1,000 feet.
- Look for obstacles around landing area.
- Follow pre-assigned pattern over landing area or alternate.
- Flare to land and PLF if necessary.

**CATEGORY B INSTRUCTOR NOTES:**
- The instructor must consider carefully before advancing students more quickly than the recommended progression during the rudimentary skills training in Categories A-C. Repetition of fewer skills during the initial categories improves success in later categories and leads to higher overall satisfaction for the student.
Administered orally after completing the jumps in this category.

1. Who must directly supervise your student training jumps? [USPA Instructor rated for my discipline (BSRs 2-1.E.2.b)]

2. What is your most important task when in freefall? [altitude awareness to recognize and act at the assigned pull altitude (Category B outline)]

3. What are the maximum winds in which any student may jump? [ten mph for a round reserve canopy; 14 mph for a ram-air reserve, waiverable by an S&TA (BSR 2-1.F.1)]

4. How would you clear a pilot chute hesitation? [Change body position to modify the air flow over my back. (Category A and B outline)]

5. In the event of a canopy problem, students should decide and act about executing emergency procedures by what altitude? [2,500 feet (SIM 5-1.E)]

6. How would you address the following routine opening problems? (Category A and B outline)
   a. Twisted lines [Spread risers or twist risers to transfer line twist to risers, kick in opposite direction, watch altitude to 2,500 feet.]
   b. Slider stops half way down [Pump rear risers or steering controls at the bottom of the stroke while watching altitude to 2,500 feet.]
   c. End cells closed [Pull toggles to flare position and hold (or pull down rear risers and hold) and watch altitude. If stubborn, determine controllability with turn and flare by 2,500 feet.]
   d. Broken lines or other damage [Determine controllability and ability to flare by 2,500 feet.]
   e. Good canopy that is turning. [Be sure both brakes are released.]

7. What is the appropriate action if below 1,000 feet without a landable parachute [Immediately deploy the reserve parachute, but not below 1,000 feet with an SOS system. (Category A and B outline)]

8. If the pilot chute goes over the front of the canopy after it has opened, how can you tell if it’s a malfunction? [If the canopy flares and turns correctly, it is probably safe to land. (Category A and B outline)]

9. What is the correct response to an open container in freefall using a hand-deployed system? [no more than two tries or two seconds to locate and deploy the main pilot chute; if no success, cut away and deploy the reserve (SIM Section 5-1.E)]

10. If part of the deployed parachute is caught on the jumper or the equipment (horseshoe), what is the correct response? [Cut away and deploy the reserve. (Category A and B outline)]

11. If the pilot chute extracts the deployment bag from the parachute container (backpack) but the deployment bag fails to release the parachute canopy for inflation, what is the correct response? [Cut away and pull the reserve. (Category A and B outline)]

12. What are the compass headings of the runway nearest the DZ at your airport? [local runway heading]

13. What compass directions do the runway heading numbers represent (northeast-southwest; north-south, etc.)? [cardinal directions of the reference runway]

14. How long is the longest runway at your airport? [local runway length]

15. Describe the three legs of the canopy landing pattern with relation to the wind direction. [downwind (with the wind), base (across the wind but downwind of the target), and final (into the wind) (Category A and B outline)]

16. At what altitude over the ground do aircraft enter the traffic pattern at your airport? [local pattern entry altitude]

17. Why is it undesirable to land off the end of a runway? [approaching and departing aircraft (Category B outline)]
By this time, you have had several opportunities to learn controlled, stable fall. Freefall students (AFF and tandem) have a head start on the point of the next lesson’s freefall skills: relaxed control using the procedure, “altitude, arch, legs, relax.”

Tandem and AFF students begin this category with two AFF Instructors but should jump with only one before advancing.

IAD and static-line students perform the first jump in this category identically to the last jump in Category B, preferably on the same day. On subsequent jumps, they practice controlled freefall for ten seconds before deployment on at least two jumps to become accustomed to the shift in direction of the relative wind from ahead to below. It also introduces them to the speed of a near-terminal-velocity freefall.

You need to establish confidence and relaxed freefall control. A controlled freefall in Category C may include some random heading drift, which you learn to lessen by relaxing and focusing on the basics: altitude, arch, legs, and relax.

The instructor shows you more about how to plan a canopy pattern for various wind speeds and directions to improve traffic flow and avoid conflicts with obstacles and other jumpers. You learn to predict, avoid, and react to turbulence induced by wind over obstacles and heated areas.

You’ll learn ways to approach an off-field landing, and the drop zone manager explains how off-field landings may affect neighbor relations.

You’ll meet the FAA-rated parachute rigger, who packs and maintains the reserve parachute. He or she will familiarize you with the closed parachute system, and you’ll observe the pre-flight equipment check.

Emergency review includes discussion on an inadvertently-opened parachute in and around the aircraft and how to avoid and respond to it. Also, study includes details on landing obstacle recognition and avoidance and how to approach off-field landings.

**Instructor: Transition Protocol**

Crossover students to AFF who have completed Category B in the static-line and IAD program will need additional training on the AFF climbout, set-up, and count; AFF freefall communications; use of the altimeter in freefall; and the main parachute deployment device, including deployment device malfunctions. IAD and static-line students may make the first jump in this category with one AFF Instructor on the recommendation of the USPA IAD or Static-Line Instructor and the concurrence of the USPA AFF Instructor.

Crossover students to IAD or static line who have completed Category B in another training method will need additional training on the static-line or IAD climbout, set-up, and exit commands and use and malfunctions of the IAD or static-line deployment system. AFF and tandem students who have completed Category B must demonstrate a stable practice deployment on an IAD or static-line jump before proceeding to a clear and pull.
EXIT AND FREEFALL

AFF STUDENTS
• demonstrate the ability to freefall safely with one AFF Instructor
• stable deployment without AFF Instructor contact

STATIC-LINE AND IAD STUDENTS
• one stable clear and pull
• two stable ten-second freefalls

ALL STUDENTS
• control within five seconds of exit
• stable, relaxed fall
• ability to dampen turns and heading drift using “altitude, arch, legs, relax”
• wave-off and pull at the assigned altitude

CANOPY
• fly a recognizable pattern with minimal assistance
• flare with minimal assistance

SPOTTING AND AIRCRAFT
• understanding of how to plan and adjust the landing pattern for wind speed and direction

ORAL QUIZ
• review BSRs on equipment required for student jumps, SIM Section 2-1.K.2 through .5
• study FAR 105.43.b.1 (SIM Section 9-1) regarding the requirements for periodic inspection and repacking of reserve parachute systems
• discuss with the drop zone owner the ramifications of off-field landings, both legal and from a neighbor and public relations perspective
• read the canopy owner’s manual
A. EXIT AND FREEFALL

1. Pull priorities:
   a. Jumpers must deploy at the planned altitude, regardless of stability.
   b. Priorities are in the following order of importance (top down):
      (1) Pull.
      (2) Pull at the correct altitude.
      (3) Pull while stable.

2. Review of smooth climbout and exit (minimal assistance)
   a. exact hand and foot placement
   b. smooth launch to reduce momentum
   c. correct presentation of hips and chest to the relative wind
   d. legs out for a few seconds to add control

3. Single-instructor exit (AFF, when applicable)
   a. Revise the climbout procedure for one instructor.
   b. Prepare for slightly different results after launch with one instructor (typically more vertical).

4. Review of stability recovery and maintenance “altitude, arch, legs, relax” (IAD and static-line students only after successful clear and pull)—
   a. know the altitude by reading the altimeter or counting from exit (depending on exit altitude)
   b. arch at the hips to improve belly-to-wind stability
   c. check your leg position and adjust as needed (probably extend to 45 degrees)
   d. relax by taking a breath and letting go of unwanted body tension
   e. recognize heading (actively correct only if turn training was introduced in Category B)

5. In-freefall, practice pulls as desired (IAD and static-line students after first successful clear and pull)

6. Alternate freefall altitude references
   a. Judge altitude by keeping track of time (average ten seconds for first 1,000 feet, 5.5 seconds for every additional 1,000 feet).
   b. Look at the ground during the climb to altitude and cross check against the altimeter.
   c. Use level cloud bases as an altitude reference.

    d. Look at the ground after initiating deployment and while waiting for inflation; check what you observed against the altimeter after opening.

7. IAD and static-line students (after first successful clear and pull):
   a. exposure to continuous freefall (two stable ten-second delays recommended to complete Category C)
   b. transition of the relative wind from opposite the aircraft heading to below
   c. altitude, arch, legs, relax
   d. wave-off to signal other jumpers prior to deployment

B. CANOPY

1. Wing loading and canopy size
   a. The wing-loading ratio is the jumper’s exit weight (geared up) divided by the square footage of the canopy.
   b. The canopy manufacturer publishes wing loading or load recommendations for each model of canopy.
      (1) in the canopy owner’s manual
      (2) on the manufacturer’s website
   c. Canopy performance changes with wing loading.
      (1) With a heavier wing loading, expect:
         (i) faster forward speed
         (ii) faster descent rate
         (iii) quicker turns

    WING LOADING EXAMPLES

<table>
<thead>
<tr>
<th>jumper’s exit weight</th>
<th>divided by canopy size (sq. ft.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>215</td>
<td>280</td>
</tr>
<tr>
<td>wing loading</td>
<td>.77:1</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>jumper’s exit weight</th>
<th>divided by canopy size (sq. ft.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>215</td>
<td>195</td>
</tr>
<tr>
<td>wing loading</td>
<td>1.1:1</td>
</tr>
</tbody>
</table>
(iv) steeper and longer dive from a turn
(v) more violent malfunctions
(vi) more skill to flare correctly
(2) With a lighter wing loading, expect
(i) less drive against a strong wind
(ii) slower turns
(iii) more forgiveness of landing errors
(iv) less predictable in turbulence
d. Use the example to calculate the wing loading for
the canopy the student is about to jump (one of
the Category C advancement criteria).
e. Canopies may appear easier to land with more
weight, to a point.
(1) A good landing in ideal conditions does not
mean a smaller canopy is safe to jump in all
conditions.
(2) A more highly loaded canopy will stall at a
higher airspeed.
f. With the same wing loading a smaller canopy of
the same model will exhibit more lively perform-
ance characteristics.
(1) faster turns and turn response
(2) quicker dynamic stall response
2. Converting forward speed to lift:
a. Flaring the canopy quickly to half brakes causes
the canopy to slow down abruptly.
b. Your momentum causes you to swing forward
briefly, raising the front of the canopy and flatten-
ing the glide.
c. Continue to flare, braking the canopy more and
holding the high nose angle to maintain your lift
while reducing the forward speed.
d. Time your flare so your feet touch the ground before
you begin to swing back under the canopy (dynamic
stall) or begin to fly backwards (full stall).
3. Turbulence sometimes occurs in the landing area.
a. Anticipate turbulence 10-20 times the height of
an obstacle on the downwind side.
b. The effects and likelihood of turbulence increase
with wind speed.
c. Turbulence often occurs—
(1) near runways
(2) alongside roads
(3) where two areas of different colors or
textures meet
Turbulence occurs downwind of an obstacle at ten to 20
times its height, depending on the strength of the wind.
4. When flying in turbulence—
   a. Maintain the desired heading using smooth but effective toggle input.
   b. Fly full speed or as directed in canopy owner’s manual.
   c. Prepare for a very hard landing.
5. Recognition of a clear field
   a. Power lines run along roads and between buildings, as well as randomly in open fields.
   b. A row of vegetation often hides a fence.
   c. Rocks, hills, and other terrain irregularities often remain invisible until just prior to touchdown.
   d. Inspect an unfamiliar landing area more closely at every 500-foot interval during descent and continuously below 500 feet.
6. Planning a landing pattern (intended landing area or alternate) for smooth flow and separation of traffic (see illustration):
   a. Jumpers on left-hand (left-turning) approaches should land on the left side of the landing area; jumpers on right-hand approaches should land on the right side of the landing area to prevent conflicts.
b. The turn from base leg to final is the most hazardous because of opposite approaching traffic.
c. See and avoid.

7. Downwind landings
   a. On calm days, downwind landings often result from winds shifting prior to landing (generally has little effect on landing speed).
   b. On windy days, jumpers sometimes fly downwind too long and run out of time to complete a turn into the wind, which would be more dangerous than landing with the wind.
   c. When faced with deciding between a low turn or a downwind landing, the downwind landing is the correct decision.
   d. When making a downwind landing—
      (1) Flare at the normal altitude, regardless of ground speed.
      (2) Roll on landing, using the PLF hard-landing procedure.
      (3) Thripping when trying to run out a high-speed landing can result in serious neck injury or death.

8. When to attempt a stand-up landing:
   a. when you’re in control of all the variables
   b. after a good flare at the appropriate altitude

C. EMERGENCY PROCEDURE REVIEW

Note: Tandem students should additionally review all Category B emergency procedures on the same day before making any jump in Category C. Static-line and IAD students should additionally review procedures for deployment handle problems, premature container opening in freefall (hand deployment), and pilot chute hesitations before making any jump in Category C.

1. Importance of deployment at the correct altitude, regardless of stability
2. Open parachute in aircraft
   a. extreme care required when leaning back against anything in aircraft
   b. importance of a pre-jump equipment check before leaving the aircraft
   c. importance of careful movement near or outside the door, especially with an AAD
   d. If a parachute opens in the plane:
      (1) If door is closed, secure the parachute and land with the plane.
      (2) If the door is open, contain the parachute, close the door, and land with the plane.
      (3) If the parachute goes out the door, so must the jumper.
3. If an off-DZ landing is unavoidable—
   a. Look for an open, clear, accessible field.
   b. Decide on an alternate landing area by 2,000 feet.
   c. Fly a predictable landing pattern.
   d. Transpose the planned landing pattern from the intended field onto the alternate field.
   e. Land well clear of turbulence and obstacles.

f. Prepare for a hard landing in any unfamiliar landing area.
g. Be considerate of the property owner when leaving the landing area.
   (1) Cross only at gates or reinforced areas.
   (2) Leave all gates as they are found.
   (3) Do not disturb cattle.
   (4) Walk parallel to (between) any rows of crops until reaching the end of the field.
   (5) Repair or replace any damaged property.

D. EQUIPMENT

1. The automatic activation device:
   a. activates the main or reserve parachute
   b. is worn only as a back-up
   Note: Detailed AAD operation is explained in Category D.

2. Observe the instructor performing the pre-flight check:
   a. top to bottom, back—
      (1) reserve pin in place and straight
      (2) reserve closing loop worn no more than ten percent
      (3) reserve ripcord cable movement in housing
      (4) reserve packing data card and seal (especially on an unfamiliar or rental rig)
      (5) AAD turned on and/or calibrated
      (6) main activation cable or pin in place, free of nicks or kinks
      (7) main closing loop worn no more than ten percent
      (8) pilot chute bridle routing or ripcord cable movement
      (9) main activation handle in place
   b. top to bottom, front—
      (1) overview operation of three-ring release—pulling the cable releases the rings
      Note: Pre-flight details for the three-ring release are covered in Category D. Disassembly and maintenance are explained in Category H.
      (2) RSL connection, routing, and basic function to back up the jumper in pulling the reserve following a cutaway
      Note: Comprehensive RSL operation is explained in Category E.
      (3) chest strap and hardware intact
      (4) cutaway handle in position
      (5) reserve handle in position
      (6) leg straps and hardware operational and correctly threaded
E. Rules and Recommendations

1. The BSRs list gear requirements for student jumps in Section 2-1.K.2 through 5.
2. The FAA also regulates the training and certification of the FAA rigger, according to FAR 65.
3. Some skydiving centers are subject to state and local rules or restrictions concerning landing off the DZ.
4. The student should discuss with the drop-zone manager about how an off-field landing may affect the jumper and the DZ.

F. Spotting and Aircraft

1. The landing pattern is square on a calm day, with each leg based on the canopy’s projected glide distance from 300 feet of altitude (see illustration).

   a. Each jumper must know his or her own canopy’s glide distance from 300 feet in no wind to plan a pattern.
   b. The instructor estimates the 300-foot no-wind glide distance for beginning students.

2. The planned final approach must be shortened from the known zero-wind square pattern as the wind increases; for example, cut the final approach approximately in half for ten mph.

3. The base leg also shortens as the wind increases; for example, also cut the base leg approximately in half for a ten-mph wind.

4. Plan the 1,000-foot pattern entry point farther upwind as winds increase; for example, double the length of the downwind leg used for calm conditions, ending at the new projected 600-foot point for ten-mph winds.
CATEGORY C FREEFALL DIVE FLOWS

AFF DIVE PLAN

- Exit in a relaxed arch.
- Circle of Awareness check.
- Practice deployment(s) until comfortable.
- Circle of Awareness check.
- Instructor(s) release grips as situation allows.
- Altitude, arch, legs, relax.
- Instructor(s) make sure of student control by 6,000 feet or regrip through deployment.
- Wave-off at 5,000 feet and deploy by 4,000 feet.

IAD AND STATIC-LINE DIVE PLAN #1: CLEAR AND PULL

- Exit on command with legs extended.
- Initiate deployment sequence as practiced on prior jumps, regardless of stability.
- Check canopy.

IAD AND STATIC-LINE DIVE PLAN #2: TEN-SECOND FREEFALL (TWO JUMPS)

- Exit with legs extended.
- Relax into neutral.
- Maintain count to ten by thousands while checking altimeter.
- Wave-off at seven seconds or 4,500 feet and initiate deployment by ten seconds or 4,000 feet, regardless of stability.

CATEGORY C CANOPY DIVE FLOW

- Release brakes and address any routine opening problems.
- Look left, turn left.
- Look right, turn right.
- Flare.
- Determine position and altitude.
- Find the landing area and pattern entry point.
- Divide the flight path by thousands of feet.
- Identify suspect areas of turbulence.
- Verify landing pattern and adjust as necessary.
- Steer over correct portion of flight path until 1,000 feet.
- Follow planned pattern over landing area or alternate.
- Flare to land and PLF.

CATEGORY C INSTRUCTOR NOTES:

- Following release by their AFF Instructors, AFF students who have not received turn training in Category B may encounter heading drift. These students should be taught to recognize a heading change, consider it acceptable, and to correct it using the “altitude, arch, legs, relax” procedure.
- Students who were taught turn technique in Category B may add “correct turn” at the end of that sequence, placing emphasis on the other four, more important points. Relaxed stability must first be established for proper, relaxed control.
- The instructor should advance students only according to the recommended progression during the rudimentary skills training in Categories A-D. Repetition of fewer basic skills improves success later.
Administered orally after completing the jumps in this category.

1. In flat and stable freefall at terminal velocity, how long does it take an average jumper to fall 1,000 feet? [5.5 seconds (Category C syllabus)]

2. What is the correct procedure for recovering from instability to the belly-to-earth position? [altitude, arch, legs, relax (Category C syllabus)]

3. Which is better, to pull at the planned altitude or to fall lower to get stable before pulling? [Pull at the planned altitude, regardless of stability. (Category C syllabus)]

4. What is the purpose of the wave-off before deployment? [signal other jumpers (Category C syllabus)]

5. What is the purpose of the parachute landing fall (PLF), and why is it important for skydivers? [protects against hard landings; and all skydivers have hard landings (Category C syllabus)]

6. What part of the landing pattern is most dangerous to skydivers? [the intersection of the base and final approach legs (Category C syllabus)]

7. How do higher wind speeds affect the planned landing pattern as compared to the pattern plan for a calm day? [shortens the final approach, shortens the base leg, lengthens the downwind leg, and places the planned pattern entry point farther upwind (Category C syllabus)]

8. In moderately strong winds, how far downwind of an obstacle would you expect to find turbulence? [10-20 times the height of the obstacle (Category C syllabus)]

9. What is the best procedure to use when flying your canopy in turbulent conditions? [Keep the canopy flying in a straight line at full flight (or as directed by the owner's manual).]

10. What weather conditions and wind direction(s) are most likely to cause turbulence at your drop zone? [according to the local landing area and obstacles]

11. Why is it important to protect your parachute system operation handles when in and around the aircraft? [keeps them in place and prevents accidental or premature deployment (Category C syllabus)]

12. Describe the equipment pre-flight strategy to use before putting on your gear. [top to bottom, back to front (Category C syllabus)]

13. How does the three-ring main canopy release system disconnect the main parachute from the harness? [Pull the cables to release the cloth loop. (closed parachute system briefing)]

14. How do you know if a reserve parachute has been packed by an FAA rigger within the last 120 days? [information found on the reserve packing data card (closed parachute system briefing)]

15. How do you know the reserve container has not been opened since the FAA rigger last closed it? [rigger's packing seal on the reserve ripcord (closed parachute system briefing)]

16. If the surface winds are blowing from west to east, which direction will you face to fly the downwind leg of the landing pattern? (instructor's illustration) [east (Category C syllabus)]

17. What is the wing loading of the parachute you will use on your next jump? [Divide the exit weight by the square footage.]

18. Which canopy size (same model design) will exhibit quicker control response?
   a. 210-square feet with a 210-pound jumper (geared up)
   b. 170 square feet with a 170-pound jumper (geared up)
   [170 square feet/170 pounds (Category C syllabus)]

19. When is it OK to attempt a stand-up landing? [when the jumper has control of all the variables and has executed a good flare at the appropriate altitude (Category C syllabus)]
Did you know that done properly, visualizing what you’re about to do can be as effective as practicing it for real? Studies show that the only part of an athlete’s performance that visualization won’t help is gaining the strength necessary to perform the task.

Exercise is hard and skydiving is expensive, but visualization is cheap and easy. To begin, go where you can relax and where distractions won’t affect you. (Potential distractions may be all around, but you can train your mind to tune them out.) Breathe rhythmically and slowly and recall or imagine a pleasant experience or moment where you are calm and very comfortable.

Then, imagine your upcoming performance exactly as you want it to occur. Start from the beginning, which includes moving to the door of the aircraft, and imagine your actions through to the end. You should even visualize your descent under canopy.

Visualize every detail: where you will place your hands and feet in the door, the cold air rushing in, the noise of the plane, the clean smell of the air, the feel of the aircraft metal on your hands, and everything you can associate with the upcoming experience.

Imagine how you will move every part of your body during the count and exit and how you will feel as you fly away from the plane. Think of where you will position your hands, feet, head, and torso, particularly as you explore techniques for maneuvering in freefall. Visualize every move, including looking at the ground, checking your altimeter, and seeing your instructors.

Some athletes visualize the upcoming performance from their point of view, while others visualize as if they were their own camera flyer, watching from above or alongside. Visualize in slow motion or real time, but no faster. See your performance as one continuous flowing action, rather than as snapshots. As you visualize your actions, associate the motions by feigning the small movements with your hands or your legs with each action ("twitch") as you mentally rehearse the performance.

Leave yourself a few minutes to take in the sights and sounds on the way to altitude, but keep your performance first on your mind. The jumpers who succeed best all practice their routines on the climb to altitude, so you shouldn’t feel out of place. Just look around at the others doing the same thing!

At this stage of your training, your performance requires as much of your attention as any skydiver training for competition. Use these same visualization tips that help top athletes in skydiving and other sports to help you improve your performance and increase your overall satisfaction from each jump.
Until now, you have learned to safely control freefall by keeping track of your altitude, focusing on a neutral body position—especially your hips and legs—and relaxing. In Category D, you’ll learn to control heading by modifying the neutral position using your upper body to deflect air. You will want to demonstrate relatively effortless control of 90-, 180-, and 360-degree freefall turns before moving on to aerobatics, introduced in Category E.

IAD and static-line students start this category with a 15-second freefall, using the altimeter. IAD and static-line students jump from progressively higher altitudes as they demonstrate control and awareness. On delays of 15 seconds or more, a USPA Instructor should accompany the student in freefall for observation and coaching.

Under canopy, you’ll explore rear riser control, which opens new safety options and adds fun to the canopy ride. Before advancing, you should demonstrate the ability to return to the drop zone and steer a planned, recognizable landing pattern without assistance. To progress to Category E, you should also by now be able to flare and land with minimal assistance. And each student should have been able to stand up a landing by the end of this category.

In Category C, you observed your instructor prepare and inspect your gear for the jump. In Category D, you’ll begin studying skydiving equipment in earnest to become responsible for your own pre-flight equipment checks. You’ll read the owner’s manual for the automatic activation device and learn how to operate one.

The USPA Instructor introduces some of the elements of spotting, which means choosing the correct exit point and guiding the pilot to it. You’ll observe jump-run operations from the door.

Study assignments include the FAA requirements for cloud clearance and visibility, which you’ll need to memorize.

**Instructor: Transition Protocol**

The USPA Tandem program terminates after Category C. All former tandem students may continue in the AFF program, or the remainder of the USPA IAD or static-line progression.

AFF and former tandem students transferring to the remainder of the IAD or static-line progression should demonstrate a stable clear and pull first.

Students transferring from the IAD or static-line program to the AFF program need to be briefed on linked exit procedures and freefall communications (hand signals) and be prepared for longer freefalls and frequent altimeter checks.
EXIT AND FREEFALL

AFF STUDENTS
- stability within five seconds after an unassisted poised exit

ALL STUDENTS
- cumulative four 90-degree turns, 20-degree tolerance
- cumulative two 180-degree and two 360-degree turns, 45-degree tolerance

CANOPY
- cumulative two 90-degree back riser turns with brakes set, 20-degree tolerance
- cumulative two 90-degree back riser turns with brakes released, 20-degree tolerance
- one 180-degree back riser turn, and one 360-degree back riser turn with brakes released, 45-degree tolerance
- two back riser flares above 1,000 feet
- stand-up landing
- landing within 50 meters of the target with minimal assistance

EQUIPMENT
- operate the AAD

SPOTTING AND AIRCRAFT
- recognize and observe the airport and the spot from the aircraft door during jump run

ORAL QUIZ
- read and memorize the table on cloud clearance and visibility requirements in FAR 105.17 (SIM Section 9-1)
- Review SIM Section (BSRs) 2-1.E.9 on daylight requirements for student jumps
- study Section 5-1.F of this manual to review building landing procedures
- study SIM 5-1.E on equipment malfunctions
- read the AAD owner's manual
- study SIM 5-3.G on AADs
A. EXIT AND FREEFALL

1. AFF students: poised exit without assistance
   Note: Instructor grips are optional, based on previous performance.
   a. Use the same climbout, set-up, launch, and flyaway procedure as on previous exits.
   b. Prepare for slightly different results without an instructor gripping the harness on exit.
   c. Altitude, arch, legs, relax.
   d. Exit without assistance and establish control within five seconds before advancing from Category D.

2. Initiating freefall turns
   a. First establish a comfortable, relaxed, neutral body position.
   b. Find a point ahead on the horizon as a heading reference (and also use the instructor).
   c. Initiate a turn by changing the level of your upper arms to deflect air to one side; the forearms should follow.
   d. Assist the turn's effectiveness by extending both legs slightly to counter the effects of tension in the upper body.
   e. Any deviation from the neutral position (as when initiating a turn) demands more effort to maintain the rest of the body in neutral.
   d. Maintain leg pressure and arch for a smooth turn.
   e. Stop small turns (90 degrees or less) by returning to the neutral body position.
   f. Stop larger turns (180 and 360 degrees) using the "start and stop" principle.
      (1) Start the turn using the turn position for the first half of turn.
      (2) Return to neutral when original heading comes into view.
      (3) Counter turn if necessary to stop on heading.
   g. To regain lost control: altitude, arch, legs, relax (neutral position), then pick a new heading to maintain.
   h. Stop all maneuvers at 5,000 feet and maintain a stable arch on heading with positive leg pressure through wave-off and deployment.
   3. Calculating freefall time according to exit altitude based on average terminal velocity of 120 mph:
      a. ten seconds for the first 1,000 feet
      b. 5.5 seconds for each additional thousand feet (round down to five seconds for an added safety margin)
      c. example: jump from 5,000 feet with a planned deployment altitude of 3,000 feet—
         (1) Allow ten seconds from 5,000 to 4,000 feet.
         (2) Add five seconds from 4,000 to 3,000 feet.
         (3) Plan a total of 15 seconds for freefall.

B. CANOPY

1. Back riser steering
   a. Steer using the back risers with the brakes still set to change heading quickly after opening.
      (1) With the brakes set, the canopy has less forward momentum to overcome for a turn.
      (2) The back risers operate more than the entire back quarter of canopy.
   b. Using risers to steer in case of a malfunctioned toggle (discussion):
      (1) Release both brakes.
      (2) You need to conserve enough strength to complete all turns with back risers until landing and still be able to flare.
      (3) Especially on a smaller canopy, you should practice riser flares many times at altitude on a routine jump before committing to a riser landing (important).
      (4) You should decide whether to land or cut away in the event of a malfunctioned toggle well before encountering the problem.
      (5) One locked brake with the other released may necessitate a cutaway; decide and act by 2,500 feet.
   c. Practice all riser maneuvers above 1,000 feet and focus on the canopy pattern and traffic from 1,000 feet down.
   d. Before making any turns, look in the direction of the turn to prevent collisions and entanglements.
   2. With minimal assistance, land within 50 meters of the target before advancing from Category D.

C. EMERGENCY PROCEDURE REVIEW

1. Training harness review (study Section 5-1.E of this manual):
a. quicker recognition and decision-making ability for good or bad canopy (lower pull altitude)
   (1) Review sample problems not requiring a cutaway and practice the procedures.
   (2) Review sample malfunctions requiring a cutaway and practice the procedures.
b. the correct procedures for testing a questionable canopy above cutaway altitude
   (1) Make two tries to clear the problem with toggles or back risers if altitude permits.
   (2) The canopy must fly straight, turn, and flare reliably to be able to land safely.
   (3) Decide to cut away or land the canopy by 2,500 feet and act.

2. Procedures for landing on a building: Refer to the procedures in Section 5-1.F of this manual.

D. EQUIPMENT

1. Automatic activation device operation
   a. The instructor or a rigger explains the basics of how to operate the AAD.
   b. More AAD information is contained in the owner’s manual, which every jumper should read.
   c. Refer to Section 5-3.F of this manual for more information on AADs.

2. Correct assembly of the three-ring release system
   Note: Disassembly and maintenance of the three-ring release is covered in Category H.
   a. Each ring passes through only one other ring.
   b. The white retaining loop passes through only the topmost, smallest ring.
   c. The white retaining loop passes through the cable housing terminal end.
   d. The release cable passes through the loop.
   e. The retaining loop is undamaged.
   f. The release cable is free of nicks, kinks, and burrs (especially on the end).

3. Pre-jump equipment checks
   Note: The instructor should guide you through a complete pre-flight equipment check using a written checklist.
   a. Before each jump, check your equipment before putting it on.
   b. With the help of another jumper, get a complete equipment check with all your gear on before boarding.
   c. Get your equipment checked once again before exiting the aircraft.
   (1) “check of threes” (jumper self-check)
      (ii) three-ring assembly (and reserve static line)
      (iii) three points of harness attachment for snap assembly and correct routing and adjustment
      (iii) three operation handles—main activation, cutaway, reserve
   (2) pin check back of system (by another jumper) top to bottom

(i) reserve pin in place (and automatic activation device on and set)
(ii) main pin in place
(iii) ripcord cable movement or correct bridle routing
(iv) activation handle in place
(3) personal equipment check (“SHAGG”)
   (i) Shoes—tied, no hooks
   (ii) Helmet—fit and adjustment
   (iii) Altimeter—set for zero
   (iv) Goggles—tight and clean
   (v) Gloves—lightweight and proper size

4. Jumpsuit or clothes
   a. access to handles—shirt tails, jackets, and sweatshirts tucked in
   b. protection on landing
   c. provide correct fall rate

Jumpers must observe the FAA requirements for visibility and clearance from clouds to avoid other aircraft flying over the drop zone.
E. RULES AND RECOMMENDATIONS

1. Cloud clearance and visibility requirements for skydivers (FAR 105.17)
   a. Memorize the cloud clearance and visibility table in FAR 105.17 (or the illustration below).
   b. The FAA places the joint responsibility for cloud clearance and visibility on the jumper and the pilot.

2. USPA requires that all student jump operations be completed prior to sunset (BSRs).

F. SPOTTING AND AIRCRAFT

1. Instructor-assisted planning with the landing pattern for the day's conditions
2. Overview of aircraft spotting and jump-run procedures (what “spotting” means):

   Note: It is recommended that a jump pilot explain spotting procedures in Category E.

   a. determining the best opening point
      (1) calculations from wind forecasts
      (2) observation and discussion of previous jumpers’ canopy descents
   b. pre-flight briefing with the pilot to discuss the correct jump run and exit points
   c. guiding the pilot on jump run
   d. verifying that the area below is clear of clouds and other aircraft before jumping

3. During jump run, observe spotting procedures and demonstrate the technique for looking straight down from the aircraft (should be accomplished before advancing to Category E).

   a. Sight from the horizon looking forward.
   b. Sight from the horizon looking abreast.
   c. The junction of the two perpendicular lines from the horizon marks the point straight below the aircraft.

4. You must get your head completely outside the aircraft to effectively look below for other aircraft and clouds.
CATEGORY D FREEFALL DIVE FLOWS

AFF DIVE PLAN #1: 90-DEGREE TURNS
- Observe spotting from the door.
- Exit in a relaxed arch (grip optional).
- Circle of Awareness check.
- Practice pull(s) (optional).
- Altitude, arch, legs, relax.
- Find a reference point on the horizon and determine the position of the instructor.
- Ask permission to turn (head nod).
- Receive reply from instructor (head nod).
- Start a turn and stop at 90 degrees.
- Altitude, arch, legs, relax.
- Perform (with instructor’s permission each time) alternating 180-degree turns until 5,000 feet (initiate no turns below 6,000 feet).
- Altitude, arch, legs, relax.
- Wave-off at 4,500 feet.
- Pull by 4,000 feet.

AFF DIVE PLAN #2: 180- AND 360-DEGREE TURNS
- Observe spotting from the door.
- Solo poised exit in a relaxed arch.
- Circle of Awareness check.
- Practice pull(s) (optional).
- Altitude, arch, legs, relax.
- Find a reference point on the horizon and determine the position of the instructor.
- Ask permission to turn (head nod).
- Receive reply from instructor (head nod).
- Start a turn and stop at 180 degrees.
- Altitude, arch, legs, relax.
- If altitude permits, turn 180 degrees back to instructor.
- Perform (with instructor’s permission each time) alternating 360-degree turns until 5,000 feet (initiate no turns below 6,000 feet).
- Altitude, arch, legs, relax.
- Wave-off at 4,500 feet.
- Pull by 4,000 feet.

IAD AND STATIC LINE:
90-, 180- and 360-Degree Turns
Note: Recommended are two 15-second delays, two 30-second delays, and then longer delays until the cumulative four 90-degree, two 180-degree and two 360-degree turns required have been accomplished.
- Observe spotting from the door.
- Exit in a relaxed arch.
- Awareness check (ground and altimeter).
- Practice pull (optional).
- Altitude, arch, legs, relax.
- Find point on ground 45-degrees ahead and below.
- Start and stop a turn on a planned heading, 90 degrees (4)
  180-degrees (2)
  360-degrees(2)
- Between each turn: Altitude, arch, legs, relax.
- Repeat turns in alternating directions until 5,000 feet.
- Altitude, arch, legs, relax.
- Wave-off at 4,500 feet.
- Pull by 4,000 feet.

CATEGORY D CANOPY DIVE FLOWS

DIVE PLAN #1
- Correct minor canopy problems (line twist, slider, end cells) using back risers with brakes set.
- Look right, turn right 90 degrees using back risers.
- Check position and traffic.
- Repeat to the left.
- Check position and traffic.
- Release brakes.
- Look right, turn right 90 degrees using back risers.
- Check position and traffic.
- Repeat to the left.
- Look right, turn right 180 degrees using back risers.
- Check position and traffic.
- Repeat to the left.
- Check position and traffic.
- Practice back riser flares.

DIVE PLAN #2
- Clean up (line twist, slider, end cells) canopy with brakes set.
- Look right, turn right 90 degrees using back risers.
- Check position and traffic.
- Repeat to the left.
- Check position and traffic.
- Release brakes.
- Look right, turn right 360 degrees using back risers.
- Check position and traffic.
- Repeat to the left.
- Check position and traffic.
- Practice back riser flares.
1. For planned deployment initiation at 3,000 feet, approximately how long should an average-sized jumper fall after exiting at 5,000 feet? [15 seconds (Category D outline)]

2. What is the most appropriate response to loss of heading control in freefall? [altitude, arch, legs, relax (Category D outline)]

3. What is the best way to avoid a canopy collision when turning? [Look first in the direction of the turn. (Category D outline)]

4. What is the quickest and safest way to change heading immediately after opening? [back riser turn with the brakes still set (Category D outline)]

5. How would you steer a parachute that has a broken brake line? [release both brakes and use the back risers to steer (Category D outline)]

6. How would you practice to prepare to land a canopy using the back risers to flare? [prior practice with rear riser flares at altitude with that canopy during a routine jump (Category D outline)]

7. Describe your procedure for landing on a building [Disconnect the RSL (if time), contact the building feet first, PLF, cut away after landing on top of a building, wait for competent help. (SIM Section 5-1.F)]

8. What is the purpose of the automatic activation device? [to back up the jumper’s emergency procedures (SIM Section 5-3.G)]

9. Describe the “check of threes.” [Check three-ring release system for correct assembly and RSL; three points of harness attachment for snap assembly or correct routing and adjustment; three operation handles—main activation, cutaway, reserve. (Category D outline)]

10. What must the spotter do to determine what is directly underneath the aircraft while on jump run? [place head completely outside the aircraft and look straight down (Category D outline)]

11. How far horizontally must jumpers be from any cloud (FAR 105.17)—
   a. below 10,000 feet MSL [2,000 feet]
   b. 10,000 feet MSL and above [one mile]

12. What are the minimum visibility requirements (FAR 105.17)—
   a. below 10,000 feet MSL? [three miles]
   b. 10,000 feet MSL and above? [five miles]

13. Who is responsible for a jumper observing cloud clearance requirements? [jumper and pilot (FAR 105.17)]

14. According to the BSRs, what is the latest a student may jump? [All student jumps must be completed by sunset. (SIM Section 2-1.E.9)]

15. Describe the technique for determining the point straight below the aircraft during jump run. [Determine two lines from the horizon, one ahead and one abreast, and find the intersection of those two lines. (Category D outline)]

16. What must the jumper look for below before exiting the aircraft? [clouds and other aircraft (Category D outline)]
During your student progression as you work toward a USPA A license, you are expected to learn to spot in routine conditions. “Spotting” simply means choosing the opening point and guiding the pilot to the correct position over the ground for exit. You can calculate the spot from a winds-aloft report. FAA Flight Service provides these reports, which you can get from the pilot.

When you’re in the door before exit, spotting starts with determining exactly what’s straight down and how the plane is moving across the ground. A good spotter’s training never ends.

Here are some tips for beginners:

1. Be familiar with the DZ and surrounding area, including the correct exit and opening points for the day’s conditions. The USPA Instructor will simply tell you at first and then show you how to figure it for yourself later.

2. Look out of the aircraft, obviously done best with the door open and your head all the way outside. Small aircraft give you more opportunities to practice spotting. In larger aircraft, your instructor will arrange some door time. First, just get comfortable looking out. Put your head all the way out into the windstream.

3. Identify the DZ, the climbout point, and exit point from the open door of the aircraft. Point them out to your instructor or coach.

4. Look straight down, using horizon reference points. Avoid using the aircraft as a reference. On jump run, the plane is often climbing, banking, skidding, or crabbing.

5. Determine the track of the aircraft. Once you can identify two points straight below the plane on jump run, you know the actual path of the aircraft across the ground. If you see that it will take you too far to the left or right, suggest a correction to the staff member supervising your jump, who will relay your corrections to the pilot.

6. Allow enough time (distance) for your climbout and set-up to separate you from other jumpers. Learn when to climb out.

Soon, you’ll give directions to the pilot under supervision. After a while, the USPA Instructor or Coach won’t interfere unless your spotting appears unsafe.

Your spotting training will require several jumps, and the staff will log your progress. Spot as often as you can during your training as a student so you’ll feel confident later when you’re on your own.
CATEGORY E—INTRODUCTION

This is the last category that distinguishes between students of different disciplines. Once you have demonstrated the ability to regain stability and control within five seconds after initiating a disorienting maneuver, a USPA Instructor in your discipline may clear you to jump without instructor supervision in freefall. At that point, any USPA Instructor may perform gripped exits with you, as well.

In Categories E and F, any USPA Instructor may conduct your training and will make sure you are properly supervised on each jump.

In Category E, you practice unpoised (door) exits and aerobatics to increase your confidence, awareness, and control in freefall. You should by now be jumping from the highest altitude available at your drop zone.

Under canopy, you’ll practice for softer landings by looking for the “sweet spot” in the flare—the flaring stroke that provides the best lift for that canopy with that jumper’s weight. The goal is the maximum lift for the longest duration, finishing just as you begin to touch down. The USPA Instructor will also remind you of your responsibility (and every jumper’s responsibility) to observe and steer clear of other canopies.

You should have landed at least once within 50 meters of the planned target without assistance to complete Category E.

Part of the emergency procedure review includes a detailed discussion on preventing premature openings in freefall and more detailed procedures for two open canopies.

A rigger or instructor will introduce you to the open parachute system to identify its key components, along with the FAA’s rules for packing parachutes. Supervised packing begins in Category F.

You’ll discuss weight, balance, airspeed, jump run procedures, and aircraft emergency procedures, usually with a jump pilot. A jump pilot or USPA Instructor also shows you how to read a winds-aloft report. From that information, you’ll learn to calculate the best opening point over the ground.

In Categories E through H, you’re expected to select and prepare your equipment for jumping (with the supervising USPA Instructor’s advice), including obtaining all recommended pre-jump equipment checks. You’re also learning to spot, where to sit in the aircraft, and to allow enough distance between the jumpers exiting before you. You should know the surface winds and plan the appropriate landing pattern.
EXIT AND FREEFALL

- cumulative two successive disorienting maneuvers with stability and altitude awareness recovered within five seconds

Note: Once this requirement is met and you have received the endorsement of a USPA Instructor in your training discipline, your training may be supervised by any USPA Instructor. You may then self-supervise in freefall, but remain under USPA Instructor supervision. A USPA instructional rating holder should accompany you in the aircraft to verify the correct spot, clearance from clouds and aircraft, exit separation, and your position in the line-up.

- cumulative one barrel roll, one backloop, and one front loop, each completed within 60 degrees of the initial heading
- one self-supervised freefall

CANOPY

- unassisted landing within 50 meters

EQUIPMENT

- complete open parachute system orientation
- RSL orientation

SPOTTING AND AIRCRAFT

- correct calculation of the opening point given simple wind conditions
- active participation with spotting procedures on jump run

ORAL QUIZ

- review BSRs on on wind restrictions for students, SIM Section 2-1.F
- read and discuss USPA recommendations on dual ram-air deployments, SIM Section 5-1.E
- read and discuss USPA recommendations on reserve static lines in SIM Section 5-3.F
- read and discuss USPA recommendations on altimeters in SIM Section 5-3.J
- read and understand FAA Part 91 sections contained in SIM Section 9-1
- read and discuss with an FAA rigger FAR 105.43.a and b (SIM Section 9-1) on parachute packing and supervision requirements for packers
A. EXIT AND FREEFALL

1. Stable door (unpoised) exit—
   a. Plan a pre-position inside the door for the best launch.
   b. Launch to present the front of your hips to the relative wind.
   c. Establish a neutral position immediately with your legs slightly extended to dampen the momentum and establish positive stability into the wind.
   d. To remain stable, maintain your arch as the relative wind changes from ahead to below after exit.

2. Recovering from exit and freefall instability—
   a. Altitude, arch, legs, relax (review).
   b. If falling stable back to earth although arching, briefly retract one arm and look at the ground to return face-to earth (half barrel roll).

3. Barrel rolls, backloops, and front loops (instructor’s preferred technique)
   a. Try barrel rolls first, because they have a built-in recovery component from back-to earth.
   b. Any two disorienting maneuvers with recovery and reorientation within five seconds qualify the jumper for self-supervision in freefall (the same one may be used twice).
   c. To advance to Category F, all three maneuvers should be completed within 60 degrees of the initial heading (self-evaluated).

4. Understanding of increased and erratic fall rate with freeflying maneuvers

5. Visual altimeters, especially when chest-mounted, may read erratically during inverted positions (see SIM Section 5-3).

B. CANOPY

1. Types of stalls
   a. An aerodynamic stall is a stable, steady-state stall, or sink, with decreased glide and increased rate of descent.
      (1) associated with older designs and specialized accuracy canopies

(2) may not be achievable with newer, flatter-gliding canopies, which often fly flatter almost until a full stall

b. A dynamic stall occurs at the end of a flare when the jumper begins to rock back under the canopy and the canopy begins to nose forward.
   (1) associated with a sharp dive
   (2) may signal a full stall

(3) may be contrary to the manufacturer’s recommendations

(4) may result in entanglement with the jumper if released too abruptly

(5) may result in injury if done too low

2. Raise the toggles smoothly after any stall to avoid diving and partial collapse.

3. Proper flare technique:
   a. feet and knees together to maintain heading during the landing flare
   b. flaring with the hands in front to provide visual feedback for even control

4. Discovering the best landing flare (“sweet spot”) for the canopy being jumped (nine practice flares):
   Note: Complete all maneuvers above 1,000 feet.
   a. From full glide, flare to a mid-point in the toggle range.
      (1) approximately the bottom of the rib cage
      (2) at a medium rate of flare
   b. Feel the amount and duration of lift before the stall.
   c. Return gently to full flight for at least ten seconds.
   d. Repeat to the same depth.
      (1) once at a faster rate
      (2) once at a slower rate
e. Compare the strength and duration of the lift before the stall.

f. Flare at three different speeds to a point deeper in the toggle stroke, approximately at the hips.

g. Flares at three different speeds to a higher point in the toggle stroke, approximately at the shoulders.

h. Compare the flares to determine the stroke rate and depth that produces the maximum combined strength and duration of lift for that canopy.

5. Best flare height above the ground

a. Use the best flare procedure (discovered during the nine practice flares) upon landing, beginning one body height above ground.

b. Flare to minimum descent (or flat) and hold that toggle position when the glide begins to flatten.

c. Smoothly continue the toggle stroke to maintain the flat glide.

d. If the canopy begins to stall and drops several feet, begin the flare that much lower on the next jump.

e. If you don’t achieve the flattest glide before landing, begin to flare slightly higher on the next jump.

6. Review of traffic avoidance procedures:

a. Watch for other traffic, especially upon entering the landing pattern.

b. The most dangerous point of the pattern occurs when two jumpers on opposite base-leg approaches turn to final approach.

c. The lower canopy has the right of way, but one jumper should not maneuver to assert right of way over another.

d. It takes two people to have a collision, but only one to avoid it.

7. Make at least one unassisted landing within 50 meters of a planned target (recommended to complete Category E).

C. EMERGENCY PROCEDURE REVIEW

1. Preventive measures for two open canopies

   a. Deploy the main parachute at the correct altitude to avoid AAD activation.

   b. Initiate malfunction procedures high enough to cut away safely and avoid AAD activation.

   c. Maintain and correctly operate hand-deployed pilot chutes, especially collapsibles.

   d. Protect handles before exit to prevent pins or handles being knocked loose.

   e. Some AADs, particularly those used for student jumping, will activate under a fully open parachute when controlled too aggressively at lower altitudes.

2. Review detailed procedures for two canopies out as they pertain to experienced jumpers, found in SIM Section 5-1.

3. Procedures for high-wind landings

   a. Before landing, disconnect the RSL as a precaution in case a cutaway becomes necessary to prevent being dragged.

   b. Choose a point to the side or well downwind of any obstacle that may generate turbulence.

   c. Land using a PLF and reel in the steering line.

   d. Upon touchdown, pull one toggle in as quickly as possible until the canopy collapses.

   e. Cut away if necessary (with an SOS, cutting away may open the reserve container, but only the reserve pilot chute will likely deploy).

OPEN PARACHUTE ORIENTATION

A rigger or instructor introduces you to the parachute system when it is unpacked. You will learn the common points of parachute wear and maintenance requirements during Category G. Assembly and maintenance of the three-ring release is covered in Category H.

1. Packing is a function of identifying and organizing the parachute.

2. Identify:

   a. pilot chute and bridle

   b. deployment bag or other device

   c. pilot chute attachment

   d. top skin and the different characteristics of F-111 (0-3 cfm) and zero-P fabric

   e. packing tabs

   f. bottom skin

   g. leading edge (nose)

   h. trailing edge (tail)

   i. center of tail (warning label or tab)

   j. stabilizers

   k. manufacturer’s label (to identify end cell)

   l. slider stops

   m. loaded and unloaded ribs

   n. crossports

   o. A, B, C, D, and brake lines

   p. line cascades, including brake lines

   q. slider and slider grommets

   r. connector links and link protectors

   s. risers and brake system

3. Review and discuss (preferably with an FAA rigger) FAR Part 105.43.a and b (Section 9-1 of this manual).

   a. who may pack a main parachute

   b. how often it needs to be packed

   c. rigger supervision of non-rated packers
D. Equipment
1. Attend the Category E Open Parachute Orientation (inset) to prepare for packing lessons.
2. Typical characteristics of elliptical canopies, compared to rectangular canopies of the same size and material:
   a. flatter glide for same airspeed
   b. faster turns
   c. greater loss of altitude in a turn
   d. may continue to dive after stopping control input following a turn
   e. slower, less predictable opening (some models)
   f. shorter toggle stroke for flare (some models)
   g. quicker, more abrupt stall (some models)
3. The stall speed of any wing increases with higher wing loading.
   a. more suspended weight
   b. sudden maneuvers
4. Use and limitations of the reserve static line, or RSL (SIM Section 5-3).

E. Rules and Recommendations
1. Winds
   a. Students are limited to 14 mph (ten mph for round reserves).
   b. A USPA Safety & Training Advisor may file a waiver for students to jump in higher winds.
   c. Licensed jumpers must exercise judgment.
4. The FAA publishes rules for the periodic inspection and repacking of the main and reserve parachute system, found in FAR 105.43.a and b, Section 9-1 of this manual.

F. Spotting and Aircraft
1. Attend the Aircraft Briefing (inset).
2. Spotting (pilot or instructor)
   a. how to read a winds-aloft report
   b. jump-run procedures
   c. spotting corrections
      (1) manual (hand signals, shoulder taps)
      (2) electronic (spotting buttons and lights)
      (3) verbal
3. The effect of winds during canopy descent
   a. A canopy descends at approximately 1,000 feet per minute.
   b. Divide the the opening altitude by 1,000 feet to determine time of descent, e.g., 3,000 feet = three minutes of descent.
   c. Estimate in miles per minute the amount of drift during descent:
4. Calculate the drift under canopy from 3,000 feet, based on the average of the known winds and a canopy descent rate of 1,000 feet per minute, to choose the correct opening point—example:
a. canopy descent time from 3,000 feet (at 1,000 feet per minute): three minutes
b. total (uncontrolled) drift at 1/4 mile per minute: 3/4 mile
c. ideal opening point: 3/4 mile due west

5. Jumper procedures during jump run
   a. The pilot determines when the door may be opened and may prefer to operate the door.
   b. Look below to—
      (1) check for clouds
      (2) check for aircraft
      (3) verify the jump run is correct
   c. When the pilot gives the OK to jump, verify that the aircraft is the desired distance from the drop zone and begin exit procedures.

6. Be sure to establish communications for spotting corrections with the pilot prior to flight.
CAGE E FREEFALL DIVE FLOWS

DIVE PLAN #1: BARREL ROLL AND RECOVERY
• Assist with spot.
• Door exit.
• Altitude, arch, legs, relax.
• Barrel roll.
• Altitude, arch, legs, relax.
• Barrel roll (or other disorienting maneuver).
• Altitude, arch, legs, relax.
• Continue aerobatics until 5,000 feet.
• Altitude, arch, legs, relax between each maneuver.
• Wave-off at 4,500 feet.
• Pull by 4,000 feet.

DIVE PLAN #2: FRONTLOOPS AND BACKLOOPS
• Assist with spot.
• Optional exit.
• Altitude, arch, legs, relax.
• Perform required aerobatics to standards until 5,000 feet.
• Altitude check between each maneuver.
• Wave-off at 4,500 feet.
• Pull by 4,000 feet.

CAGE E CANOPY DIVE FLOW
• Check position and traffic.
• Flare to chest at a medium speed and hold.
• Recover to full flight for ten seconds.
• Check position and traffic.
• Flare to chest at a quicker speed and hold.
• Recover to full flight for ten seconds.
• Check position and traffic.
• Flare to chest at a slower speed and hold.
• Recover to full flight for ten seconds.
• Evaluate the most effective flare according to the strongest sustainable lift (“sweet spot”).
• Initiate the best flare at head height above the ground.
• Continue to flare to maintain a flat glide until landing.
• Evaluate the flare height according to the landing results.

CAGE E EQUIPMENT
• Open Parachute Orientation

CAGE E SPOTTING AND AIRCRAFT
• Aircraft Briefing

CAGE E INSTRUCTOR NOTES:
• Each student should complete the equipment and spotting and aircraft procedures training before advancing to Category F.
• When possible, an FAA rigger should conduct the Open Parachute Orientation and review of the FARs on packing.
• When possible, a jump pilot should conduct the Aircraft Briefing and overview of the pertinent sections of FAR 91.
1. What happens to a jumper's fall rate when performing acrobatics (rotational aerial maneuvers) or freeflying maneuvers? [increases (Category E outline)]

2. What happens to a visual altimeter when it's in the jumper's burble? [reads erratically; unreliable (SIM 5-3.I)]

3. What is the best way to recover from a stall to full glide? [Smoothly raise the toggles to control acceleration. (Category E outline)]

4. Define an aerodynamic stall as it applies to a ram-air canopy. [stable state of decreased glide and increased rate of descent (Category E outline)]

5. When does a dynamic stall occur? [at the end of a flare when the jumper begins to rock back under the canopy (Category E outline)]

6. What happens after a dynamic stall if the tail is held lower than the nose? [full stall (Category E outline)]

7. What is the best way to determine a canopy's optimum flare speed and depth for landing? [Practice different rates of flare entry at different depths of flare. (Category E outline)]

8. Describe your procedure for landing in high winds [Stay well downwind of any obstacle, face into the wind early, disconnect the RSL, pull one toggle down completely after landing, cut away if necessary. (Category E outline)]

9. How many A lines does a nine-cell canopy have? [ten (Category E Open Canopy Orientation)]

10. To what part of the canopy do the steering lines (brake lines) connect? [tail or trailing edge (Category E Open Canopy Orientation)]

11. What lines go through the rear slider grommets? [C, D, and brakes (Category E Open Canopy Orientation)]

12. Where does the main pilot chute bridle attach to the canopy? [top center (Open Canopy Orientation)]

13. Who may pack a main parachute? [FAA rigger, person jumping the parachute, person under rigger's supervision (FAR 105.43)]

14. How often do the main and reserve parachute need to be packed? [every 120 days (FAR 105.43)]

15. Who is in command of the aircraft? [pilot (FAR 91.3.A)]

16. Name two purposes for wearing seat belts in an aircraft. [to maintain the correct balance; protection in a crash (Category E Aircraft briefing)]

17. Who is responsible that the aircraft is in condition for safe flight? [pilot (FAR 91.7.B)]

18. Above what altitude MSL is the pilot of an unpressurized aircraft required to breathe supplemental oxygen? [14,000 feet (FAR 91.211.A.2)]

19. Above what altitude MSL are all occupants of an unpressurized aircraft required to breathe supplemental oxygen? [15,000 feet (FAR 91.211.A.3)]

20. In an aircraft with the exit door near the back, what must jumpers do to maintain the balance during exit procedures? [remain forward until it is time for their group to exit (Category E Aircraft Briefing)]

21. What is the biggest danger to a jumper when flying the canopy pattern? [other canopies (Category E outline)]

22. What is the best way to avoid a canopy collision? [See and remain clear of other jumpers. (Category E outline)]

23. How does the RSL work? [forms a separable link between the main riser and reserve ripcord so that cutting away the main activates the reserve, if the RSL is hooked up (SIM Section 5-3.F)]

24. What would happen if the main riser attached to the RSL breaks? [The reserve deploys with the main still attached by the other riser. (SIM Section 5-3.F)]

25. What is the best way to prevent risers from breaking? [inspection and maintenance; correct packing, tight line stowage, and stable deployment, all to prevent hard openings (SIM Section 5-3.F)]

26. Name one way to prevent a dual deployment. [Open at the correct altitude; deploy the main parachute at the correct altitude to avoid AAD activation; initiate malfunction procedures high enough to cut away safely and avoid AAD activation; maintain and correctly operate hand-deployed pilot chutes, especially collapsibles; protect handles before exit to prevent pins or handles being knocked loose; maneuver gently below the AAD’s firing range (Category E outline)]

27. What is generally the best action to take in the following two-canopy-out scenarios (SIM 5-1.E)?
   a. Biplane [Release the brakes on the dominant canopy only and steer that canopy gently; PLE]
   b. Side by side [Release the brakes on the dominant canopy only and steer that canopy gently; or release the RSL (if time) and cut away; PLE]
   c. Downplane [Release the RSL (if time) and cut away.]
Skydiving is a sport for individualists who like to do things together. In the first portion of the USPA Integrated Student Program, Categories A-E, you focused on the skills required to survive independent freefall: stability control, deployment at the correct altitude, landing in a clear area, and other survival skills.

The remaining three categories, F-H, prepare you for more advanced freefall control. More importantly, you get ready for skydiving in groups—in freefall and under canopy.

Education continues in canopy flight, equipment, and aircraft skills essential for safety. Soon, you’ll graduate and become independent of supervision. Detailed review also continues on the emergency procedures introduced in the first-jump course.

With the direct assistance of other qualified staff members, such as the USPA Coach, the USPA Instructor continues to supervise your training and monitor your progress during all remaining student jumps until you obtain your USPA A license.

The freefall portions of Categories F through H address group flying techniques and skills. Under the supervision of a USPA Instructor, a USPA Coach may train you for the freefall skills in these last three categories and accompany you in freefall.

After completing all training and jumps at the end of Category H, you may sign up for a USPA A-license check dive with a USPA Instructor.
CATEGORY F—INTRODUCTION

Tracking is a basic group skydiving skill that enables jumpers to gain sufficient freefall separation for a safe opening. It is such an important skill that the freefall training in this category is devoted entirely to tracking techniques.

To begin, while supervising yourself in freefall, you practice the basics of the delta position working towards a flat track. The USPA Coach will evaluate and refine your tracking skills as part of the jumps in Categories G and H. Tracking evaluation is also part of the A-license check dive with the USPA Instructor.

Flying the canopy slowly and performing flat, altitude-conserving turns is an important skill that can help you out of a difficult landing approach in a tight area.

You'll learn more about how to handle aircraft emergency exit procedures independently. Emergency review includes power line recognition, avoidance, and landing procedures. Former AFF students should make their required clear-and-pull jump from 3,500 feet, following a practice clear and pull from 5,500 feet, during this category.

By this time, you're ready to learn how to pack and should begin working with a packing instructor. The school should provide the owner's manuals for the parachute system and canopies you're using.

The staff continues to build your understanding of aircraft procedures on jump run with emphasis on separation between groups exiting on the same pass. You also learn the specific procedures for coordinating with the pilot or jumpmaster in the event of an aircraft emergency.
EXIT AND FREEFALL
• cumulative three tracking sequences: track for ten seconds within 30 degrees of the planned heading, turn 180 degrees, and track back for ten seconds
• two clear and pulls (already accomplished by former IAD and static-line students)

CANOPY
• cumulative four 180-degree turns (within 20 degrees) under canopy while flying in deep brakes
• braked approach and landing on a canopy that allows for a safe braked landing
• cumulative two unassisted landings within 25 meters of the planned target (jumps from previous categories count toward accuracy requirements)

EQUIPMENT
• one complete pack job with assistance
• perform a pre-jump equipment check on another jumper fully rigged and ready to jump

AIRCRAFT AND SPOTTING
• spot the aircraft, including all procedures, with minimum assistance

ORAL QUIZ
• study USPA Basic Safety Requirements for A license holders (SIM Sections 2-1.B; F.2; G.2; H.1.a, H.2, and H.3; K.5; and L)
• study USPA recommendations on recurrent training (SIM Section 5-2)
• study SIM Section 5-1.F to review power line landing procedures
• study USPA recommendations on group separation during jump run (SIM Section 5-7)
• read the owner’s manuals for the main and reserve canopies and the harness and container system in use for jumps in this category
A. EXIT AND FREEFALL

1. Initiating track with a delta
   a. First establish a heading by locating a point on the horizon.
   b. Extend your legs completely in a fluid manner to initiate forward motion.
   c. Control in the delta and track positions:
      (1) Dip one shoulder slightly in the direction of the turn to make heading corrections (instructor technique may differ).
      (2) Corrections are limited to heading maintenance and small turns.
   d. Slowly extend your torso by stretching your shoulders toward the ears.
   e. Fully extend your arms to the side and then sweep them back at an angle of 45 degrees to your spine and level with your hips (instructor technique may vary).

2. Refining the flat delta to a track
   a. Once establishing a heading in a positive forward dive, fully extend both legs with your knees locked and toes pointed.
   b. Stiffen your body slowly into a slight reverse arch, pushing down and forward slightly with your shoulders.
   c. Continually adjust your body position to effectively meet the relative wind.

3. Tracking practice procedure
   a. Experienced jumpers often allow only five to ten seconds to obtain adequate separation.
   b. Practice entering and refining an on-heading track for ten seconds, reversing direction, and repeating (three sequences required with 30 degrees of heading tolerance to complete Category F).

4. Tracking jump safety
   a. Fly exactly perpendicular to the jump run to avoid others up and down the line of flight.
   b. Always plan tracking dives with other groups in mind.
   c. Learn to control a delta on heading first, then develop techniques for speed.

5. Clear and pull (AFF students only—IAD and static-line students have already met the clear-and-pull requirement in Category C.)
   a. A clear and pull is used for emergency exits and pre-planned low-altitude jumps.
   b. Use a familiar, stable exit technique.
   c. Present your hips to the relative wind and execute normal pull procedures (without wave-off) to deploy within five seconds of exit.
   d. Expect the parachute to open in relation to the relative wind, not overhead as usual.
   e. The sequence consists of a clear and pull from two altitudes:
      (1) first from 5,500 feet
      (2) once successful, from 3,500 feet

B. CANOPY

1. Braked turns:
   a. Performed correctly, braked turns provide the quickest heading change with the least altitude lost.
   b. A braked turns may be the best choice when a quick heading change is needed.
      (1) when suddenly encountering another jumper under canopy or someone in the landing area
      (2) suddenly recognizing an obstacle
      (3) too low to recover from a full-flight turn
   c. Practice braked turns.
      (1) From the slowest speed at which the canopy will fly, raise one toggle slightly to initiate a heading change in the opposite direction.
      (2) Try to change heading as quickly as possible without banking or stalling (four 180-degree braked turns recommended to complete Category F).

2. Using brakes to attain the maximum glide and minimum descent:
   a. On lower-glide designs, the minimum descent may begin nearer the half-braked position.
   b. On higher-glide designs, the minimum descent may be nearer the three-quarter braked position or just prior to a full stall (reverse flight).
   c. Some canopies achieve minimum descent using the back risers instead of the toggles.
d. Minimum sustainable descent (float):
   (1) allows the jumper to remain above other jumpers on descent
   (2) allows the canopy to cover a greater distance

3. Recognizing and adjusting for minimum descent and maximum glide (“accuracy trick”):
   a. Look ahead to the point on the ground that appears not to rise or sink in the jumper’s field of vision.
      (1) Everything before that point appears to fall.
      (2) Everything beyond it appears to rise.
      (3) That point is the projected landing point on the canopy’s current glide slope.
   b. Pull the toggles down slightly to see if the stationary point moves farther away.
      (1) If so, the glide slope has flattened.
      (2) The canopy will cover more distance.
   c. Repeat until the point begins to move closer, then return to the maximum glide position that you have just determined.

4. When flying downwind in maximum glide:
   a. As the winds decrease at lower altitudes, your glide slope will degrade.
   b. The actual landing area will be closer than you initially anticipated.

5. Increasing the glide when flying against the wind:
   a. in lighter winds, may improve distance
   b. in stronger winds, may slow the canopy too much and reduce its upwind range

6. Braked pattern and landing approach
   a. Fly one entire landing pattern in at least half brakes, to determine the effect on glide path.
   b. Plan for a change in glide slope.
      (1) A lower-glide design may require a smaller pattern when flown in brakes.
      (2) A higher-glide design may require a bigger pattern when flown in brakes; extend the final approach to avoid overshooting the target.
   c. Fly final approach in half to three-quarter brakes (recommended before advancing to Category G).
   d. Flare carefully from the braked position:
      (1) Practice high to avoid a stall.
      (2) To get the best flare may require a shorter, quicker stroke initiated lower to the ground.
      (3) The stall may occur more abruptly.
      (4) Plan for a PLF.
   e. A smaller canopy may descend too quickly in deep brakes for a safe braked landing.

7. Accumulate two unassisted landings within 25 meters of the planned target (recommended before advancing to Category G).

C. EMERGENCY PROCEDURE REVIEW
1. Recognizing and avoiding power lines
   a. Expect power lines along roads, between buildings, in paths in the forest, and in random places.
   b. Scan every 500 feet of descent into an unfamiliar landing area and continually scan below 500 feet.

2. Power-line landing emergency procedures (training harness): Refer to Section 5-1 of this manual.

D. EQUIPMENT
1. Pack at least one parachute with the assistance of a knowledgeable packer (recommended before advancing to Category G).
2. Discuss the most important points of packing:
   Note: An FAA rigger is your best resource for this discussion.
   a. lines straight and in place in the center of the completed pack job
   b. slider up
   c. tight line stows to prevent premature line deployment

3. Perform a pre-jump equipment check on another jumper who is in full gear (recommended before advancing to Category G).
   a. “check of threes” in the front
      (1) three-ring assembly (and reserve static line)
      (2) three points of harness attachment for snap assembly and correct routing, adjustment, and no twists
      (3) three operation handles—main activation, cutaway, reserve
   b. pin check back of system, top to bottom
      (1) reserve pin at least halfway seated (and automatic activation device on)
      (2) main pin fully seated
      (3) ripcord cable movement or correct bridle routing
      (4) if collapsible pilot chute, check the indicator window
      (5) activation handle in place
   c. check personal equipment (“SHAGG”)
      (1) Shoes—tied, no hooks
      (2) Helmet—fit and adjustment
      (3) Altimeter—set for zero
      (4) Goggles—tight and clean
      (5) Gloves—lightweight and proper size
E. RULES AND RECOMMENDATIONS

1. Study USPA BSRs applicable to USPA A-license holders, including Sections 2-1.B; F.2; G.2; H.1.a, 2, and 3; K.5; and L.
2. Study USPA recommendations on training following periods of inactivity, Section 5-2 of this manual.

F. SPOTTING AND AIRCRAFT

Note: This section should be conducted by a jump pilot or USPA Instructor.

1. Acting without a rated USPA instructor during routine jump operations and aircraft emergencies
   a. The person spotting the load usually serves as the jumpmaster.
   b. In larger aircraft, the jumpmaster should establish an exclusive chain of communication with the pilot.
      (1) A communication assistant should be able to communicate directly with the pilot and the jumpmaster simultaneously.
      (2) Other jumpers should not get involved in communication among the pilot, communications assistant, and the jumpmaster.

2. Review of low-altitude exit procedures
   a. The jumpmaster must determine if jumpers are over a safe landing area and communicate this information to the pilot.
   b. Establish firm altitudes at which certain aircraft emergency decisions would be made (DZ policy):
      (1) altitude below which all jumpers will land with the aircraft
      (2) altitude below which all jumpers will jump using their reserves
      (3) altitude below which all jumpers will jump and immediately use their main parachutes
   c. Jumpers must maintain correct weight distribution in the aircraft, especially during emergency exit procedures.

3. The effect of the winds aloft on the exit point
   a. Subtract the speed of the headwind on jump run (if flown into the wind) from the airspeed of the aircraft to determine the ground speed.
   b. Jumpers first get thrown forward on exit (approximately 0.2 miles in calm winds) from residual aircraft speed and then fall straight down or blow toward the target.
   c. The winds aloft will cause freefalling jumpers to drift according to the wind’s strength and direction.
   d. Winds generally diminish at lower altitudes.
   e. Average the speed and the direction of the winds from exit altitude to 3,000 feet AGL to approximate projected freefall drift. Example (for a sea-level drop zone):

<table>
<thead>
<tr>
<th>Altitude</th>
<th>Heading</th>
<th>Speed (mph)</th>
</tr>
</thead>
<tbody>
<tr>
<td>3,000</td>
<td>250</td>
<td>07</td>
</tr>
<tr>
<td>6,000</td>
<td>260</td>
<td>14</td>
</tr>
<tr>
<td>9,000</td>
<td>270</td>
<td>16</td>
</tr>
<tr>
<td>12,000</td>
<td>290</td>
<td>23</td>
</tr>
<tr>
<td>Average:</td>
<td>270</td>
<td>15</td>
</tr>
</tbody>
</table>

(Note: Averaging wind force and direction works sufficiently in common jump conditions. A vector analysis provides more accurate results.)

(1) If flying jump run upwind, use the average heading of 270 degrees.
(2) Aircraft forward throw is approximately 1/8-1/4 mile upwind in the light-to-moderate headwind.
(3) Jumpers fall for one minute, drifting at 1/4 mile per minute for 1/4 mile of drift.
(4) Since the forward throw and the freefall drift approximately cancel each other, the ideal exit point is almost straight over the ideal opening point in this example.

4. Group separation on jump run (see Section 5-7 of this manual).
5. Perform all duties on jump run with minimum assistance (recommended before advancing to Category G), including—
   a. operating the door (if the pilot allows)
   b. monitoring progress during jump run
   c. directing the pilot to the correct spot
   d. choosing the correct exit point
CATEGORİF F FREEFALL DIVE FLOWS

DIVE PLAN #1: TRACKING
• Spot with minimal assistance.
• Optional exit.
• Delta for ten seconds, turn 180 degrees, return.
• Altitude check.
• Repeat until 6,000 feet.
• Wave off and pull by 3,500 feet.

DIVE PLAN #2: CLEAR AND PULL FROM 5,500 FEET
(former AFF students only)
• Spot with minimal assistance.
• Poised exit.
• Initiate deployment within five seconds.

DIVE PLAN #3: CLEAR AND PULL FROM 3,500 FEET
(former AFF students only)
• Spot with minimal assistance.
• Poised exit.
• Initiate deployment within five seconds.

CATEGORİF F CANOPY DIVE FLOW
• Discovery of stall point.
• Discovery of flattest glide; lowest descent.
• Practice flaring from deep brakes.
• Identify all the power lines in the area during descent.
• Fly the pattern in brakes.
• Landing flare from brakes (with suitable canopy).

CATEGORİF F EQUIPMENT
• Pack with assistance.
Administered orally after completing the jumps in this category.

1. What is the best way to change the direction of canopy flight while conserving the most altitude? [braked turns (Category F outline)]

2. What happens if a canopy is controlled too deeply in the brakes? [stalls (Category F outline)]

3. Describe the difference between flaring from half brakes and full glide. [requires quicker stroke, stroke is shorter, stalls occur sooner (Category F outline)]

4. How does the half-braked position affect the canopy's flight? [slows descent, changes glide (Category F outline)]

5. How is heading corrected during a track? [Dip one shoulder slightly in the direction of the turn. (Category F outline)]

6. When making tracking jumps from a large plane, why is it important to track perpendicular to the jump run? [to avoid other groups ahead and behind (Category F outline)]

7. What is the ground speed of a jump aircraft with an airspeed of 90 knots when flying against a 50-knot headwind on jump run? [40 knots (pre-flight planning)]

8. How can jumpers assure adequate separation between groups exiting the aircraft? [gauge separation according to position over the ground (SIM Section 5-7)]

9. What are the three most important aspects of packing the main canopy? [lines straight and in place in the center, slider up, tight line stows (Category F outline)]

10. How can you tell if the RSL is routed correctly? [clear path from snap shackle to guide ring (Category F outline)]

11. What is the make and model of parachute system you are jumping:
   a. Main canopy?
   b. Harness and container system?
   c. Automatic activation device?

12. What is the minimum pull altitude allowed for student skydivers and A license holders? [3,000 feet (SIM 2-1.G)]

13. What are the maximum winds allowed for student skydivers? [14 mph (SIM 2-1.F)]

14. If a jumper falls for one minute through upper winds averaging 30 mph from the west (Category F outline):
   a. How far will the jumper drift? [1/2 mile] Note: 60 mph = 1 mile per minute; therefore, 30 mph = 1/2 mile per minute.
   b. In which direction? [east]

15. Describe your procedure for landing in power lines. [Avoid the area early during the descent, minimum braked turn necessary to avoid lines, land parallel to the wires, braked landing, prepare for PLF, try to touch only one line at a time, wait for help and confirmation that the power has been turned off and will remain off until recovery operations are complete. (SIM 5-1.F)]

16. In the event of an aircraft emergency with no students or instructors aboard, who should coordinate procedures between the pilot and the other jumpers on the load? [jumpmaster, or spotter (Category F outline)]

17. At your drop zone, what is the lowest altitude the pilot would likely ask jumpers to leave the plane during a routine engine-out emergency? [DZ policy]

18. In an aircraft emergency, what is the lowest exit altitude that you would deploy your main parachute before choosing the reserve instead? [school policy]

19. What should an A-licensed jumper do to regain currency after a ten-week period of inactivity? [make at least one jump under the direct supervision of a USPA Instructor (SIM Section 5-2, Recurrency Training)]

20. What should an A-licensed jumper do to regain currency after a four-month period of inactivity? (SIM Section 5-2, Recurrency Training)
   a. if trained in the AFF method [make a jump in Category D]
   b. if trained in the IAD or static-line method [make a jump in Category B]
THIS PAGE INTENTIONALLY LEFT BLANK
CATEGORY G—INTRODUCTION

Freefall skills in Category G address group skydiving maneuvers. They are outlined for the discipline of formation skydiving (flat, or belly flying) but can be performed in other orientations by a USPA Coach knowledgeable in those techniques. The same performance and advancement criteria for maneuvering, docking, breakoff, and gaining separation for a safe opening apply.

In Category G, you'll review more in depth the procedures for avoiding and responding to canopy collisions, always more of a risk in group jumping. By now, you should be looking for traffic and steering with back risers before releasing your brakes.

After opening, you'll explore the performance envelope of the ram-air canopy to prevent surprises near the ground. Practice includes maximum-performance turns, reverse turns, and keeping the wing in balance during performance maneuvers to avoid a line twist. You’ll learn to feel the turn.

You’ll take another look at avoiding tree landings and what to do in case one is inevitable.

By now, you should be packing with minimal assistance, although supervision is still advisable. Along with practicing packing, you'll learn how to inspect the equipment for wear and how to prevent it. Before advancing, you should understand the responsibilities of the FAA rigger, who maintains most items.

All skydivers need to respect the power of various kinds of weather, which begins with understanding basic weather patterns and reading the danger signals. A pilot or instructor advises you on practical ways to predict the kind of weather that could compromise your safety.
EXIT AND FREEFALL
- two cumulative redocks from ten feet without assistance
- two cumulative redocks requiring an adjustment in fall rate
- break off at the planned altitude without prompting
- track 50 feet within ten degrees of the planned heading

CANOPY
- four cumulative maximum-performance reverse canopy turns
- two unassisted landings within 20 meters of the target (jumps from previous categories count toward accuracy requirements)

EQUIPMENT
- one complete pack job without assistance

AIRCRAFT AND SPOTTING
- spot the aircraft, including all procedures, without assistance

ORAL QUIZ
- read and discuss USPA recommendations for canopy collisions (SIM Section 5-1.H)
- read and discuss USPA recommendations for tree landings (SIM Section 5-1.F)
- read and discuss USPA recommendations to experienced jumpers for automatic activation devices and reserve static lines (SIM Sections 5-3.F and G.)
- read and discuss USPA recommendations regarding weather (SIM Section 5-5)
- read and discuss USPA recommendations on group freefall skydiving, SIM Section 6-1
- read and discuss additional USPA recommendations on breakoffs for freeflying groups in SIM Section 6-2.E.5
- read and discuss FAR 65.125 through .133 (performance standards for parachute rigger privileges, record keeping, and seal requirements)
- read and discuss FAA regulations for packing main and reserve parachutes (FAR 105.43.a and b)
- read and discuss FAA regulations for maintaining automatic activation devices (FAR 105.43.c)
## A. EXIT AND FREEFALL

1. **Group exits**
   - Practice for a position in the door or on the strut for an efficient climbout and launch.
     1. Each jumper in a group has an assigned exit position and should know that position before climbout.
     2. The exit position should include specific, exact foot and hand placement for the best launch position and presentation of hips and limbs into the relative wind.
     3. The jumpers count together with body movement, where possible, for a simultaneous or near-simultaneous launch.
   - Exit into a flying position with legs slightly extended—
     1. to interact with more air for improved exit stability
     2. for an advantage to begin motion towards your partner immediately
   - Establish stability independently on exit before looking at and turning toward your partner.
   - **Exit grips:**
     1. If taken, grips should allow all jumpers to leave in a natural flying position at the initial presentation into the relative wind.
     2. Main lift web and chest strap grips are counterproductive for most belly-to-earth group exits.
   - Exit into a flying position with legs slightly extended—
     1. to interact with more air for improved exit stability
     2. for an advantage to begin motion towards your partner immediately
   - Establish stability independently on exit before looking at and turning toward your partner.
   - **Exit grips:**
     1. If taken, grips should allow all jumpers to leave in a natural flying position at the initial presentation into the relative wind.
     2. Main lift web and chest strap grips are counterproductive for most belly-to-earth group exits.

2. **Forward and backward movement (belly to earth)**
   - Use legs only for forward movement and steering.
     1. Extending both legs tilts the jumper head-low and begins a slide in that direction.
     2. Extending one leg more than the other causes a turn in the opposite direction.
       i. Extending the right leg causes a left turn.
       ii. Extending the left leg causes a right turn.
   - Maintain both arms in the grip position during forward movement and docking.

3. **Adjusting fall rate (belly to earth)**
   - Increase vertical freefall speed by streamlining.
     1. Hips forward
     2. Shoulders back
     3. Relax abdominal muscles
   - Slow freefall speed by creating maximum turbulence.
     1. Cupping the shoulders around the sternum
     2. Rounding the spine (cupping the abdomen)
     3. Extending arms or legs to counterbalance and maintain a level attitude
   - When recovering altitude from below the level of a formation:
     1. Turn sideways to keep the formation in view.
     2. To avoid a collision, remain clear of the area immediately below and above any group.
   - Recognize the visual cues for level approach (on exit, regardless of the horizon):
     1. Backpack in sight—come down
     2. Front of the leg straps in sight—come up
   - Maintain altitude awareness.

4. **Docking**
   - Dock from a level approach.
   - Once docked, arch across the shoulders to maintain the fall rate (elbows up) and stay level with your partner or the formation.
   - Extend both legs to counter any tension created in the formation when holding grips.
   - Maintain altitude awareness.

5. **Break-off**
   - Check altitude every four or five seconds and after each maneuver or stalled attempt
   - Break off without prompting (recommended before advancing to Category H).
   - Plan the break-off altitude to allow enough time to track 50 feet (recommended before advancing to Category H).
d. The most positive way to signal break-off is to turn and track.
   (1) As a safety back-up in Categories G and H—
      (i) If the coach waves his or her arms, you should immediately turn and track to the
          planned deployment altitude.
      (ii) If the coach deploys, you should also deploy immediately without tracking.
      (iii) You must deploy at planned altitude whether or not you have turned or
           tracked.
      (iv) Never rely on the USPA Coach for breakoff or deployment cues.

(2) You are always responsible to break off and open at the planned altitude on jumps with
    the USPA Coach and with others after you get your license.

d. When tracking, establish and maintain the correct heading radially from the formation.

e. For beginners, tracking moderately in a straight line in the right direction is more effective
   than going fast in a curve or in the wrong direction. Break off high enough to gain separation.

6. For additional requirements for break-offs from freeflying jumps, see SIM Section 6-2.

7. To avoid hard openings, jumpers should slow to minimum freefall velocity before deploying.

B. CANOPY

1. Performance turn entry and exit with balance
   a. Enter a turn only as quickly as the canopy can maintain balance (center of lift over the center of
      load) during the turn.
   b. Surging, lurching, or line twist indicate a turn entered too quickly.
   c. A canopy is more susceptible to collapse from turbulence during entry and exit from a turn.
   d. The canopy dives sharply after a maximum-performance turn.

2. Reverse turns
   a. You must know the maximum safe rate of turn entry for each canopy you jump.
   b. Practicing reverse turns helps you determine the maximum safe toggle turn rate before inducing a
      line twist.
   c. A line twist at pattern altitudes may be unrecoverable in time for a safe landing, particularly with a
      higher wing loading.
   d. Make a smooth but deep turn at least 90-degrees to the right, then reverse toggle positions smoothly
      but quickly for a 180-degree turn to the left (four sets recommended to complete Category G).
   e. In case you induce a line twist, you should complete all maximum-performance turns above the 2,500-foot
      decide-and-act altitude for a cutaway.

3. The potential for collision with other jumpers increases when making performance maneuvers in traffic or near
   the ground (review).
   a. Other jumpers may be focused more on the target than on traffic.
   b. The lower jumper has the right of way.
   c. It takes only one jumper to avoid a collision.

4. Accumulate two unassisted landings within 20 meters of a planned target (five total required for A license).

C. EMERGENCY PROCEDURE REVIEW

Note: A USPA Instructor should teach this section. A canopy formation specialist is also a good source.

1. Canopy collision avoidance (review)
   a. Know where other nearby jumpers are during opening and steer with the back risers to avoid them.
   b. If a head-on collision is pending, both jumpers should turn right.

2. Collision response: Study the USPA recommended procedures in Section 5-1 of this manual.

3. Tree landing avoidance
   a. Spot clear of large areas of trees or other obstacles, and open high enough to clear them in the event
      of a bad spot.
   b. Fly in maximum glide to reach a clear area.

4. Tree landing procedure review (training harness): Refer to the procedures in Section 5-1 on skydiving
   emergencies in this manual.

D. EQUIPMENT

Note: An FAA rigger should conduct this session:

1. Detailed identification and inspection of high-wear items requiring rigger maintenance
   a. pilot chute and deployment handle
      (1) Look for broken stitching around the apex and the seam where the pilot chute canopy fabric and mesh meet.
      (2) Check for security at the bridle attachment point.
      (3) The fabric and mesh should be in good condition; both eventually wear out.
   b. bridle velcro
      (1) Velcro anywhere degrades with use and needs to be replaced every 100-250 uses.
      (2) Bridle velcro is particularly important, because if it comes loose, it can cause a premature deployment.
      (3) Velcro should be clean, dry, and free of debris.
   c. deployment bag
      (1) Look for distortion in the grommets, especially at the bridle, and fabric damage around their edges.
(2) Check the loops that hold the line stow bands.
(3) If velcro is used, replace it as necessary.

d. closing pin
(1) Check that the loop holding the closing pin to the bridle is secure and not being cut by the eye of the pin.
(2) Check for nicks or corrosion on the pin and replace it if any appear.

e. pilot chute attachment
(1) Look for wear where the bridle attaches to the canopy.
(2) Look for broken stitching on the canopy itself where it is reinforced for the bridle attachment loop or ring.

f. likely areas of damage on the top center skin, end cells, and stabilizers
(1) Check for small holes on the top skin from where the bridle attachment stop ring has caught fabric in the bag's top grommet (avoidable with good packing technique).
(2) Look for wear on the top skin and end cells caused by contact with sharp objects or stickers.
(3) Look for wear in and around the reinforcements in the stabilizers that contain the slider stops.
(4) Look for broken or missing stitching along the seams.

g. slider
(1) Inspect for distortion in the slider grommets and wear around their edges.
(2) Sliders are important, high stress components and should be maintained to the highest standard.

h. lines
(1) Look for wear anywhere along the lines, but especially where the slider grommets contact metal connector links.
(2) Line damage at the links calls for line replacement, but the rigger can also advise the jumper about link choices, protection and habits that minimize damage.
(3) Lines sometimes shrink unevenly over time.
(4) All lines eventually require replacement.

i. slider bumpers (metal connector links)
(1) Slider bumpers protect the slider grommets and lines from damage by taking it themselves; most require periodic replacement.
(2) Slider bumpers need to be tight on the link or secured to prevent them from sliding up the lines and stopping the slider.

j. brake system
(1) Placing the toggles on the risers immediately after landing prevents velcro damage and tangles.
(2) Velcro needs to be replaced when worn.
(3) Velcro and general use wears the lower brake lines, which a rigger can easily replace.
(4) Examine the brake lock eye for damage and wear.
(5) Look at the attachment point for the keeper ring, including the attachment ring stitching on the opposite surface of the riser.
(6) Inspect tuck-tab toggle keepers for security.

k. riser release system
*Note: You will learn three-ring disassembly and maintenance in Category H.*
(1) Look for wear in the loops holding the rings and the white retaining loop, especially if you drag your rig when stowing the lines (not advised).
(2) Be sure that any service bulletins on risers for that system have been accomplished.
(2) Check the fittings on both ends of the cable housings for security.
(3) Look for kinks in the release cable where it contacts the white retaining loop, which may indicate a problem with hard openings or the design and construction of the three-ring assembly.
(4) Check the front and back of the riser webbing for fraying or strains around the edges of the grommets.
(5) Look for broken or loose tackings on the cable housings.
(6) Check riser inserts (for cutaway cable ends) if installed.

l. riser covers
(1) Replace any retaining velcro when it loses tackiness.
(2) Replace distorted tuck flaps when they become ineffective (happens with use).

m. main container closing grommets
(1) Inspect for distortion and fabric damage around the edges.
(2) Feel for severe distortion or breakage of the plastic stiffener inside the fabric where the grommet is set.

n. main and reserve pin covers
(1) Replace velcro when it fails to stay firmly attached.
(2) Replace plastic stiffeners when distortion from use renders them ineffective.

2. Store the parachute in a cool, dry, dark place.

a. Heat weakens AAD batteries; cars are too hot for safe prolonged storage in the summer.

b. The ultraviolet rays of the sun degrade nylon.

c. moisture
(1) corrodes hardware (very dangerous, since rust degrades nylon)
(2) promotes mildew (undesirable but harmless to nylon)

d. Many chemicals and acids damage parachute materials.
e. Heat may weaken elastic stow bands.

3. Premature deployments become more dangerous in groups.
   a. AADs
      (1) Use caution when wearing an AAD, especially near an open aircraft door and during climbout.
      (2) Adhere strictly to the manufacturer's service standards to improve their chances for correct operation, to help prevent premature AAD activations, and to comply with the law.
   b. Remain clear of the area directly above and below another jumper, in case his or her parachute activates prematurely from the AAD or other unplanned event.

4. Pack one main parachute without assistance (recommended before advancing to Category H).

E. RULES AND RECOMMENDATIONS

Note: An FAA rigger should teach this section.

   1. It requires at least an FAA senior rigger to maintain and repair the parachute system (FAR 65.125 through .133, Section 9-1 of this manual).

   2. AADs, if installed must be maintained according to the manufacturer's instructions (FAR 105.43.c, Section 9-1 of this manual).

F. SPOTTING AND AIRCRAFT

Note: A pilot or instructor should teach this section.

   1. Refer to the information on weather in Section 5.5 of this manual and discuss:
      a. weather conditions hazardous to skydivers
      b. practical methods to observe weather and obtain forecasts

   2. Select the spot and guide the pilot to the correct position without assistance in routine weather conditions (recommended prior to advancing to Category H).
Dive Plan #1: Forward Movement to Dock

- Coach observes spot.
- Front floater exit position (outside strut) until successful.
- Initiate count after coach OK.
- Face the direction of flight until stable (two to three seconds).
- Coach moves into position and docks.
- Check altitude and nod.
- Coach backs up five feet and adjusts levels as necessary.
- Move forward and take grips.
- Altitude check every five seconds or after each maneuver, whichever comes first.
- Coach backs up ten feet; move forward and take grips.
- Altitude check every five seconds or after each maneuver, whichever comes first.
- Repeat until breakoff.
- Initiate break-off at 5,500 feet and turn to track.
- Coach remains in place and evaluates track.
- Wave off and pull by 3,500 feet.

Dive Plan #2: Up and Down

- Coach observes spot.
- Rear floater exit position (inside strut) until successful.
- Initiate count after coach OK.
- Face direction of flight until stable.
- Turn to face coach.
- Coach moves into position and docks.
- Check altitude and nod.
- Coach backs up five feet and increases fall rate.
- Remain in position and match coach’s fall rate.
- Altitude check every five seconds or after each maneuver, whichever comes first.
- Coach slows fall rate.
- Remain in position and match coach.
- Repeat until response is quick and accurate.
- Break off at 5,500 feet.
- Coach remains in place and evaluates track.
- Wave off and pull by 3,500 feet.

Dive Plan #3: Docking with Problems

- Coach observes spot.
- Review either floater position.
- Initiate count after coach OK.
- Face direction of flight until stable.
- Turn to face coach.
- Coach moves into position and docks.
- Check altitude and nod.
- Coach backs up ten feet and changes fall rate.
- Match coach’s fall rate to level and dock.
- Altitude check every five seconds or after each maneuver, whichever comes first.
- Repeat until response is quick and accurate.
- Break off at 5,500 feet.
- Coach remains in place and evaluates track.
- Wave off and pull by 3,500 feet.

Category G Canopy Dive Flows

- Clear for traffic.
- Make a sharp, balanced 90-degree turn.
- Reverse the toggle position aggressively and make a balanced 180-degree turn.
- Check position and traffic.
- Repeat to no lower than 2,500 feet, in case of line twist.
- Coach observes the student’s landing distance from a planned target.

Category G Equipment

- Owner inspection of equipment briefing by FAA rigger
- Pack without assistance
category g quiz

Administered orally after completing the jumps in this Category.

1. What is the primary directional control when moving forward to dock in freefall? [legs (Category G outline)]

2. What is the minimum break-off altitude for freefall in groups of five or fewer? [1,500 feet above planned deployment altitude (SIM Section 6-1.C)]

3. What is the danger of entering a toggle turn too quickly? [line twist (Category G outline)]

4. What does a canopy do after completing a maximum input toggle turn? [dives (Category G outline)]

5. What are the three biggest dangers of a hard toggle turn near the ground? [line twist, collision with jumpers, collision with the ground (Category G outline)]

6. What are the first things to do in the event of a collision and entanglement with another jumper? [check altitude, establish communication (SIM 5-1.H)]

7. What is the most critical aspect of closing the main container equipped with a hand-deployed pilot chute? [bridle routing and placement (packing lesson)]

8. Why is it a bad idea to drag the harness and container system when stowing the lines? [unnecessary wear on the three-ring release webbing and loops (Category G outline)]

9. When velcro is used on the brake system, why is it a good idea to place your toggles back on the velcro after you land? [covers the hook velcro, which can damage other components, prevents tangles (Category G outline)]

10. Who may maintain a main parachute system? [FAA rigger (FAR 65.125.a.1)]

11. Why is it bad to leave a parachute in the sun? [Ultraviolet rays degrade nylon. (Category G outline)]

12. What damage could occur from storing a parachute for prolonged periods in a car during the summer? [shorter life for AAD batteries, stow band degradation (Category G outline)]

13. What happens to velcro touch fastener when it is used frequently? [loses tackiness (Category G outline)]

14. What happens to stiffened tuck flaps that are frequently used? [distortion (Category G outline)]

15. Who publishes and enforces rules regarding parachute packing and parachute maintenance? [FAA (rigger briefing)]

16. What may result if recovering altitude (floating up) under a freefall formation? [collision with formation, funnel (Category G outline)]

17. What extra care is required when wearing an AAD near the open door of an aircraft or when climbing out? [AAD activation near the open door of an aircraft presents a dangerous situation. (Category G outline)]

18. Why is it important to remain clear of the area directly above and below other jumpers in freefall? [possibility of AAD activation or other accidental or unplanned pack opening (Category G outline)]

19. Why is it important to maintain an automatic activation device to the manufacturer's standards? [to improve their chances for correct operation, to help prevent premature AAD activations, to comply with the law (Category G outline)]

20. What is the correct response to a canopy entanglement with another jumper below 1,000 feet if it appears the two canopies cannot be separated in time for a safe landing? [Deploy the reserve (may not be a safe option with an SOS system). (SIM Section 5-1.H)]

21. Describe your procedure for landing in trees. [Face into the wind, prepare for PLF, flare to half brakes, protect face and under arms, wait for help. (SIM 5-1.F)]

22. What does a tall cumulus cloud indicate? [thunderstorms in the area (SIM Section 5-5)]

23. What is the most dangerous part of an incoming front for aircraft and skydivers? [thunderstorms in the gust front; rapid and significant changes in winds (SIM Section 5-5)]
The last category of the ISP prepares you for the USPA A-license so you can supervise yourself as an independent skydiver.

Freefall skills combine gross movements using the start and stop principle to swoop toward a position in the sky relative to another jumper, followed by the fine movements to safely dock that you learned in Category G. The freefall briefing includes a discussion on safety and the importance of recognizing and controlling formation approach speeds. You’ll also learn to look around while tracking, signaling for pull, and during deployment.

Under canopy, students with sufficient upper body strength explore the use of the front risers. The instructor explains the benefits and dangers of front-riser maneuvers. The discussion includes how to best recover from a turn made too low, one of the sport’s biggest killers.

The emergency procedure review covers unintentional water landings.

You should be able to demonstrate how to maintain the three-ring release system and replace a main container closing loop, two common owner operations.

Although A-license holders are not qualified for demonstration jumps, you will be authorized to jump off the regular DZ into landing areas meeting the BSRs for students and A-license holders. In this last category as a formal skydiving student, you’ll study the FAA requirements for jumps into the airspace over a private field, including what additional approvals may be necessary for the jump aircraft. This discussion should be with a jump pilot who can discuss those sections of FAR 105.
EXIT AND FREEFALL
• two swoops and docks with minimum assistance
• break off at the planned altitude without prompting
• track 100 feet within ten degrees of the planned heading

CANOPY
• two cumulative 90-degree front-riser turns
• two cumulative 180-degree front-riser turns
• total of five unassisted landings within 20 meters of the target (A-license requirement)

EQUIPMENT
• disassemble, perform owner maintenance, and reassemble three-ring release system
• remove and replace or adjust a main container closing loop

ORAL QUIZ
• study USPA recommendations on unintentional water landings (SIM Section 5-1.F)
• study USPA recommendations on recovery from low turns (SIM Section 5-1.I)
• review the breakoff recommendations for groups in SIM Section 6-1
• skim FAR 105.13 to overview radio requirements for jump operations
• study FAR 105.15 and AC 105.2, Appendix 1 (prior notice requirements before jumping)
• skim AC 105.2, Appendix 2 (aircraft approved for flight with door removed)
A. EXIT AND FREEFALL

1. Diver exit
   a. Twist out the door to place hips and chest into the air coming from ahead of the aircraft, with the body oriented side-to-earth.
   b. Exit in a slow-fall position to arrest the forward throw from the aircraft, which is flying the exiting jumper away from the jumpers already out.
   c. Before starting to dive, hold the slow-fall position for two to three seconds while slowly turning toward the formation.
   d. Use a delta position to begin diving toward the target.

2. Using your spine to adjust dive angle
   a. Initiate the swoop with legs fully extended.
   b. Follow the person ahead closely, and be prepared to slow rapidly.
   c. Pitch up or down by curving the spine to increase or flatten the angle of the dive.
   d. Use fast- and slow-fall technique to adjust vertical position relative to the diver ahead.
   e. For safety and to prevent a collision, dive with an escape path in mind.

3. Traffic on approach to the formation
   a. Dive in a straight line.
   b. Prevent collisions by watching for other jumpers while on approach to the formation.

4. Start and stop
   a. Once you are about halfway to the target, return to a more neutral position.
   b. You can increase your speed to the target if you find you have slowed too soon.
   c. Use a reversing position (arms forward) to slow and stop at a position level and 10-20 feet away from the target; visual cues:
      (1) back pack in view: approaching too high
      (2) front of harness in view: approaching too low
   d. Begin a level approach using legs only.
   e. Remain aware of traffic to each side and for errant jumpers below the approach path.

5. Rapidly arresting forward movement (very effective)
   a. Extend both arms forward.
   b. Use slow-fall technique (cup sternum and abdomen).
   c. Drop both knees.

6. Breaking off and tracking
   a. Plan break-off altitude high enough for the jumper with the least experience to track to a safe distance from the formation, at least 100 feet for groups of five or fewer (minimum distance required for A-license check dive).
   b. breakoff
      (1) The minimum breakoff altitude recommendations contained in the section on Group Freefall in this manual apply to very experienced formation skydivers jumping at a familiar location, using familiar equipment, and jumping with familiar people.
      (2) If any of these conditions are not met, add 500-1,000 feet to your planned breakoff.
   c. Develop techniques to scan and steer clear of other jumpers ahead and below.
   d. Look sideways and above for other jumpers in the immediate area during wave-off and deployment so you can steer clear under canopy as soon as you open.

B. CANOPY

1. Using front risers
   a. Front risers may be used to dive the canopy:
      (1) to lose altitude rapidly
      (2) to maintain position over ground in strong winds
      (3) to catch up with another jumper under canopy below
      (4) to have fun
   b. Heading control with front risers depends on
      (1) airspeed
      (2) the rate of turn
      (3) the speed of turn entry
   c. Heading control with front risers takes practice to become predictable.
d. Practice front-riser turns to control heading within 20 degrees (recommended to complete Category H, unless the student can’t pull the front risers).
   (1) Pull both front risers down to dive straight ahead.
   (2) Pull one front riser to complete two 90-degree and two 180-degree turns.

e. Initiate a sharp, deep front-riser turn, raise the riser slightly to decrease the turn rate, and then pull the riser fully down again to attempt to increase the rate of the turn.
   (1) The rate of turn may not increase.
   (2) The resistance on the riser may make it too difficult to pull the riser down farther after raising it.
   (3) This exercise demonstrates the different nature of front-riser heading control.

f. Complete all front-riser maneuvers by 1,000 feet.

2. Front-riser safety
   a. Watch for traffic below and to the sides prior to initiating a front-riser dive.
   b. Front riser maneuvers can be very dangerous near the ground:
      (1) Turbulence may affect canopy heading or descent rate.
      (2) A mishandled front-riser turn can lead to an undesirable heading, e.g., towards an obstacle, without time to complete the turn safely before landing.
      (3) A crowded landing pattern is never the place for high-speed maneuvers.
   c. Keep both steering toggles in hand when performing front-riser maneuvers to make heading changes more reliably and quickly if necessary.

3. Accuracy: perform the remaining unassisted landings within 20 meters of the planned target to meet the USPA A-license requirements (five total required).

C. EMERGENCY PROCEDURE REVIEW

1. Refer to the Section 6-5 in this manual, “Water Landing Recommendations.”

2. Water hazards
   a. Definition of a water hazard (BSRs, Section 2-1)
   b. Flotation devices—
      (1) Are required for some jumpers; refer to the BSRs on Parachute Equipment
      (2) Are recommended for jumpers using ram-airs when jumping within a mile of water
   c. Adjust the planned spot to avoid bodies of water.

3. Procedures for an unintentional water landing (see Section 5-1 in this manual)

4. Recovery from a turn made too low (see Section 5-1 in this manual)

D. EQUIPMENT

Note: An FAA rigger or instructor should teach this section.

1. Owner maintenance of three-ring release system (required for A license)
   a. Disassemble the system every month to clean the cable and massage the ends of the risers.
      (1) Nylon riser webbing develops a memory, especially when dirty.
      (2) When disassembled, twist and massage the nylon webbing around the two riser rings.
   b. Clean the cables (required for USPA A license).
      (1) Most three-ring release cables develop a sludge-like coating that causes them to bind, increasing the required pull force.
      (2) Refer to the manufacturer’s instructions for cleaning instructions.

2. Use the correct bands for each type of lines:
   a. Smaller lines require the smaller bands.
   b. Larger bands may be required for larger lines.
   c. Line stow bands should grasp the line stow bights tightly, resulting in six to 11 pounds of force to extract.
   d. Replace each stow band as it stretches, wears, or breaks.

3. Main closing loop
   a. Damage greater than ten percent warrants replacement.
   b. Tension
      (1) Tension must be sufficient to keep the container closed in freefall.
      (2) The closing pin should require eight to 11 pounds to extract (or check owner’s manual).
      (3) A loose closing loop could result in a premature deployment.
      (4) Freeflying maneuvers increase the importance of closing system security.
      (5) Adjust the closing loop tension by moving the overhand knot or replacing the loop with the knot tied in the correct place (required for USPA A license).
   c. Use only closing loop material approved by the harness and container manufacturer.

E. SPOTTING AND AIRCRAFT

Note: An FAA-rated pilot or instructor should teach this section.

1. Overview of aircraft radio use requirements
   a. The jump aircraft must have an operating radio for jumping to take place.
   b. The pilot must be in contact with air traffic control prior to jumping.
   c. Skim the FAA’s requirements for radio use in FAR 105.
2. FAA notification required before a jump
   a. A jumper or the pilot must notify the appropriate air traffic control facility at least one hour prior to jumping (no more than 24 hours prior) in most airspace.
   b. Some drop zones have a written notification renewed annually for that location only.
   c. Skim FAR 105.15 for rules on notifications and authorizations prior to jumping.
   d. Study the overview of notification and authorization requirements contained in AC 105.2, Appendix 1.

3. Aircraft approved for flight with door removed
   a. Some aircraft are unsafe for flight with the door open or removed.
   b. Aircraft approved for flight with the door removed may require additional modifications and usually require additional FAA field approval.
   c. Other modifications to a jump aircraft, e.g., in-flight doors, hand holds, or steps, require additional field approval or a supplementary type certificate.
   d. Review with the pilot the certificates of approval for modifications on the jump aircraft.
CATEGORY H FREEFALL DIVE FLOW

Dive Plan: Swooping
- Exit from the door one second after the coach.
- Present belly to wind in the slow fall position and maintain it for two seconds.
- Coach establishes fall rate and holds heading.
- Turn toward coach.
- Dive and stop level ten to 20 feet out.
- Altitude check every five seconds.
- Approach and take grips.
- Altitude permitting, coach dives to a point 50 to 100 feet laterally and 20 to 40 feet below.
- Follow and repeat docking procedure.
- Break off at 5,000 feet.
- Coach remains in place and evaluates track.
- Wave off and deploy by 3,000 feet.

CATEGORY H CANOPY DIVE FLOW

- Check position and traffic.
- Perform an on-heading front riser dive.
- Check position and altitude.
- Perform a 90-degree front riser turn.
- Check position and altitude.
- Perform a 180-degree front riser turn.
- Check position and altitude.
- Enter a front riser turn, let up halfway and begin the turn again.
- Complete all front riser maneuvers by 1,000 feet.
- Coach observes your landing distance from a planned target.

CATEGORY H EQUIPMENT

- Disassemble, clean, and reassemble a three-ring riser release system.
- Replace or adjust a main closing loop.

USPA A-LICENSE CHECK DIVE FLOW

INSTRUCTOR: Refer to SIM Section 3-2 for complete instructions on conducting the USPA A License examination and check dive. This jump must be evaluated by a USPA Instructor:

- Spot.
- Choose a comfortable exit.
- Perform a figure-8 and backloop.
- The evaluator moves 20 feet from the candidate and level.
- Dock on the evaluator.
- Initiate breakoff and track a minimum of 100 feet.
- Wave off and pull by 3,000 feet.
- Follow your pre-selected landing pattern.
Administered orally after completing the jumps in this category.

1. Why is it important to look ahead during a swoop toward other jumpers in freefall? [see others and avoid a collision (Category H outline)]

2. What is the fastest way to slow down from a freefall swoop approach? [slow fall position with arms forward and knees down (Category H outline)]

3. What is the danger of a loose or worn main container closing loop? [premature deployment (Category H outline)]

4. Why must three-ring release cables be cleaned periodically? [corrosion deposits cause them to bind (Category H outline)]

5. If you see that you have begun to turn too low to the ground for a safe landing, what should be your first response? [neutralize the turn, get the canopy overhead (SIM Section 5-1.I)]

6. What effect does pulling on the front risers have on the canopy? [dramatic increase in rate of descent (jump experience)]

7. When performing front riser maneuvers, what should you do with the toggles? [Keep them in your hands. (Category H outline)]

8. What are the two biggest dangers of front riser maneuvers near the ground? [collisions with other jumpers, collision with the ground (Category H outline)]

9. What are some of the possible results of a turn made too low to the ground? [serious injury or death (SIM Section 5-1.I)]

10. Describe your procedure for landing in water [Inflate flotation device, disconnect chest strap and RSL, prepare for PLF, face into wind, flare, hold breath, cut away once feet are wet, remove leg straps, swim upwind; if under the canopy, dive deep and swim away or follow one seam until out from underneath. (SIM Section 5-1.F)]

11. What is the maximum percentage of visible wear allowable on a main closing loop? [ten percent (Category H outline)]

12. Can a jump be legally made from an aircraft without an operating radio? [no (FAR 105.13.a.1)]

13. What is the least notification the FAA requires before any jump or series of jumps may be made? [one hour (FAR 105.25.a.3)]

14. Where can a pilot look to determine if a plane is approved for flight with the door removed? [AC 105.2, Appendix 2, or aircraft owner’s manual]

15. Whose name will the FAA require when filing a notification for parachute jumping? [person giving notice (FAR 105.15.a.6)]
section five

GENERAL RECOMMENDATIONS

Section Summary:

This section of the SIM provides USPA recommendations for skydiving generally applicable to all jumpers, regardless of discipline or experience. USPA updates them as equipment and techniques change.

Experience shows that proficiency in any skill depends on how often the skill is exercised, especially with skills that require presence of mind, coordination, sharpness of reflexes, and control of emotions.

Important Reference Numbers

- skydiving emergencies—5-1
- recurrency training (according to experience)—5-2
- RSLs and AADs—5-3.F and G
- pre-jump checklist—5-4.C
- hazardous weather for jumpers—5-5.B
- aircraft—5-6
- spotting—5-7

Who needs this section?

- all active skydivers
- instructors preparing to conduct recurrency training (Section 5-2)
- all jumpers studying for USPA license examinations
THIS PAGE INTENTIONALLY LEFT BLANK
SKYDIVING EMERGENCIES

A. PRACTICE EMERGENCY PROCEDURES
1. Regular, periodic review, analysis, and practice of emergency procedures prepares you to act correctly in response to problems that arise while skydiving.
2. Annually review all parachute emergency procedures in a training harness.
3. Long lay-offs between jumps not only dull skills but heighten apprehensions.
4. Before each jump, review the procedures to avoid emergency situations and the procedures to respond to emergencies if they occur.

B. PREVENTION AND PREPARATION
1. Proper preparation and responsible judgment greatly reduce the probability of encountering an emergency situation, but even with the most careful precautions emergencies may still occur from time to time.
2. Skydiving is made safer by always anticipating and being prepared to respond to the types of emergencies which are likely to arise.
3. Failure to effectively deal with an emergency situation is one of the greatest causes of fatal incidents in skydiving.
4. Safety results from reducing risk:
   a. Acquire accurate knowledge.
   b. Jump only in suitable conditions.
   c. Evaluate the risk factors.
   d. Know your personal limitations.
   e. Keep your options open.

C. TAKE ACTION
1. Deploy the parachute.
   a. Open the parachute at the correct altitude.
   b. Stability in a stable, face-to-earth body position improves opening reliability but is secondary to opening at the correct altitude.
2. Promptly determine if the canopy has properly opened.
3. Perform the appropriate emergency procedures and open the reserve parachute if there is any doubt whether the main canopy is open properly and controllable.
4. Land in a clear area—a long walk is better than landing in a hazardous area.
5. Land safely—land with your feet and knees together in preparation for performing a PLF (parachute landing fall) to avoid injury.

D. AIRCRAFT EMERGENCIES
1. Each skydiving center should establish and review procedures for all possible aircraft emergencies.
2. Every pilot and non-student jumper should thoroughly understand these procedures.
3. All students should take direction from their instructor(s).

E. EQUIPMENT EMERGENCIES

PARACHUTE MALFUNCTIONS (GENERAL)

1. The majority of all malfunctions can be traced to three primary causes:
   a. poor or unstable body position during parachute deployment
   b. faulty equipment
   c. improper or careless packing
2. Malfunction procedures
   a. Refer to Category A of the Integrated Student Program for specific, basic procedures for dealing with parachute malfunctions.
   b. In addition, other procedures are discussed in this section for licensed jumpers who may need to adjust procedures to accommodate different techniques, equipment, and personal preferences.
3. All malfunctions can be classified as one of two types:
   a. total malfunction (parachute not activated, or activated but not deploying):
      (1) A total malfunction includes deployment handle problems (unable to locate or extract the main parachute deployment handle), pack closure, and a pilot chute in tow.
      (2) If altitude permits, the jumper should make no more than two attempts to solve the problem (or a total of no more than two additional seconds).
   b. procedures:
      (1) In the case of no main pilot chute deployment (e.g., missing or stuck handle, ripcord system container lock), deploy the reserve.
      (2) hand-deployed pilot chute in tow malfunction procedures (choose one):
         (i) For a pilot-chute-in-tow malfunction, there are currently two common and acceptable procedures, both of which have pros and cons.
         (ii) An instructor should be consulted prior to gearing up, and each skydiver should have a pre-determined course of action.

Procedure 1:
   Pull the reserve immediately. A pilot-chute-in-tow malfunction is associated with a high descent rate and requires immediate action. The chance of a main-reserve entanglement is slim, and valuable time and altitude could be lost by initiating a cutaway prior to deploying the reserve.
Procedure 2:
Cut away, then deploy the reserve. Because there is a chance the main parachute could deploy during or as a result of the reserve activation, a cutaway might be the best response in some situations.

b. partial malfunction (parachute deployed but not landable):
   (1) A partial malfunction is characterized by deployment (removal from the container) or partial deployment of the main parachute and includes, horseshoe (container open), bag lock, streamer, lineover, line pressure knots, major (unlandable) canopy damage, and other open-canopy malfunctions.
   (2) The recommended procedure for responding to partial malfunctions is to cut away the main parachute before deploying the reserve.

c. You should decide upon and take the appropriate actions by a predetermined altitude:
   (1) Students and A-license holders: 2,500 feet.
   (2) B-D license holders: 1,800 feet.

d. At some point during descent under a partial malfunction, it becomes too low for a safe cutaway and you must deploy the reserve without cutting away.

e. Consider the operating range of the automatic activation device when determining your personal malfunction response altitudes.

PREMATURE MAIN CONTAINER OPENING

1. With a throw-out main pilot-chute deployment system (pilot chute deployment prior to closing pin extraction), the container can open before the pilot chute is deployed, causing one type of horseshoe malfunction.

2. Prevention
   a. good equipment and closing system maintenance
   b. careful movement in the aircraft and during climbout and exit
   c. avoiding jumper contact that involves the main closing system

3. Upon discovery that the main container has opened, the recommended response is as follows:
   a. First, attempt to deploy the main pilot chute for no more than two tries or two seconds, whichever comes first.
   b. Failing that, cut away and deploy the reserve.
   c. Out-of-sequence pilot-chute extraction:
      (1) On systems with a bottom-of-container mounted pilot chute, premature extraction of the bag prior to pilot-chute deployment may make the pilot chute difficult to locate and extract.

(2) On any throw-out hand-deployed system, the pilot chute should be capable of extraction in reverse sequence by the jumper or from tension on the main bridle caused by the deployed parachute in the event of this type of malfunction.

TWO CANOPIES OUT

1. Various scenarios can result in having both parachutes deploy with one of the following outcomes:

2. One canopy inflated, another deploying
   a. Attempt to contain the deploying reserve or main canopy and stuff it between your legs.
   b. If the second canopy deployment is inevitable and there is sufficient altitude, disconnect the reserve static line and cut away the main.
   c. If the second deployment is inevitable and there is insufficient altitude for a cutaway, wait for inflation of the second canopy and evaluate the result.
      (1) The two open canopies typically settle into one of three configurations, biplane, side-by-side, or downplane.
      (2) Trying to force one configuration into a more manageable configuration is typically futile and can be dangerous.

3. Stable biplane
   a. Unstow the brakes on the front canopy and recover gently to full flight.
   b. Leave the brakes stowed on the rear canopy.
   c. Steer the front canopy only as necessary to maneuver for a safe landing.
   d. Use minimal control input as necessary for landing.
   e. Perform a parachute landing fall.

4. Stable side-by-side (choose one procedure)
   a. If both canopies are flying without interference or possibility of entanglement and altitude permits:
      (1) Disconnect the RSL.
      (2) Cut away the main and steer the reserve to a normal landing.
   b. Land both canopies.
      (1) Release the brakes of the dominant canopy (larger and more overhead) and steer gently with the toggles.
      (2) Land without flaring and perform a parachute landing fall.

5. Downplane or pinwheel
   a. Disconnect the reserve static line if altitude permits.
   b. Cut away the main canopy and steer the reserve to a normal landing.

6. Main-reserve entanglement
   a. Attempt to clear the problem by retrieving the less-inflated canopy.
   b. Perform a parachute landing fall.
F. LANDING EMERGENCIES

WATER HAZARDS

1. Procedures for an unintentional water landing:
   a. Continue to steer to avoid the water hazard.
   b. Activate the flotation device, if available.
   c. Disconnect the chest strap to facilitate getting out of the harness after landing in the water.
   d. Disconnect the reserve static line to reduce complications in case the main needs to be cut away after splashing down.
   e. Steer into the wind.
   f. Loosen the leg straps slightly to facilitate getting out of the harness after splashing down.
      (1) If you loosen the leg straps too much, you may not be able to reach the toggles.
      (2) Do not unfasten the leg straps.
   g. Prepare for a PLF, in case the water is shallow (it will be nearly impossible to determine the depth from above).
   h. Enter the water with lungs filled.
   i. After entering the water, throw your arms back and slide forward out of the harness.
      (1) Remain in the harness and attached to the canopy until actually in the water.
      (2) If cutting away (known deep water only), do so only after both feet contact the water.
      (3) If flotation gear is not used, separation from the equipment is essential.
   j. Dive deep and swim out from under the collapsed canopy.
   k. If covered by the canopy, follow one seam to the edge of the canopy until clear.
   l. In swift or shallow water, pull one toggle in or cut away.
   m. Refill your lungs at every opportunity.
   n. Swim carefully away upwind or upstream to avoid entangling in the suspension lines.

2. If using the Air Force type (LPU) underarm flotation equipment—
   a. Although worn underneath, the bladders inflate outside the harness, so removal of the harness is not practical without first deflating the bladders.
   b. If you must remove the harness after landing, the bladders should be deflated, extricated from the harness, and reinfated (orally) one at a time.

3. The risks of a water landing are greatly increased when a jumper wears additional weights to increase fall rate.
4. Camera flyers, skysurfers, and other skydivers carrying additional equipment on a jump need to plan their water landing procedures accordingly.

5. Other references
   a. SIM Section Section 2-1, USPA Basic Safety Requirements on water jumping equipment
   b. SIM Section 6-5, Water Landing Recommendations (unintentional and intentional)

POWER LINES

1. Power lines present a serious hazard to all aviators; know where they are at or near your DZ.
2. Identify power lines in the landing area as early as possible and steer to avoid them.
3. If a low turn is necessary to avoid a power line:
   a. Make the minimum, flat, braked turn necessary to miss the line.
   b. Execute a braked landing and flare.
   c. Prepare for a hard landing (PLF).
4. If a power line landing is unavoidable:
   a. Drop any ripcords or other objects.
   b. Bring a ram-air canopy to slow flight.
   c. With a round canopy, place your hands between the front and rear risers on each side.
   d. Prepare for a PLF with your feet and knees tightly together and turn your head to the side to protect your chin.
   e. Land parallel to the power lines.
   f. Do not touch more than one wire at a time.
   g. If suspended in the wires:
      (1) Wait for help from drop zone and power company personnel; nylon conducts electricity at higher voltages.
      (2) Verify with the power company only that electrical power is off and will stay off.
      (3) If the computer controlling the power distribution senses a fault in the line, computer-controlled resets may attempt to turn the power back on without warning.

TREES

1. Avoid trees by careful spotting and a good approach pattern plan for the conditions.
2. The potential dangers of landing in a tree extend until you are rescued and safely on the ground.
3. Make any low-altitude avoidance turns from braked flight to avoid an equally dangerous dive following a turn from full flight.
4. If a tree landing is unavoidable:
   a. With a ram-air canopy, hold the toggles at half brakes until tree contact.
   b. Prepare for a PLF; often the jumper passes through the tree and lands on the ground.
c. Protect your body.
   (1) Keep feet and knees tightly together.
   (2) Do not cross your feet or legs.
   (3) Cover your face with your hands while holding your elbows tight against your stomach.
d. Steer for the middle of the tree, then hold on to the trunk or main branch to avoid falling.
e. If suspended above the ground, wait for help from drop zone personnel to get down.
f. Don't attempt to climb down from a tree without competent assistance (rescue personnel or properly trained drop zone staff).

BUILDINGS AND OTHER OBJECTS

1. Plan your landing approach to be well clear of objects.
2. Fly far enough from objects that another jumper or your own misjudgment does not force you into a building or other hazardous object.
3. Make any low-altitude avoidance turns from braked flight to avoid an equally dangerous dive following a turn from full flight.
4. If landing on a building or object cannot be avoided, prepare for a PLF.
5. Strike the object feet first, whether landing on top or into the side of the object.
6. If on top of an object in windy conditions:
   a. Disconnect the reserve static line (if possible) and cut away the main parachute.
   b. If landing with a reserve, retrieve and contain the canopy until removing the harness.
   c. Wait for competent help.

G. FREEFALL COLLISIONS

1. A collision danger faces jumpers exiting in a group or on the same pass when they lose track of each other.
2. Differential freefall speeds may reach upwards of 150 mph horizontally and vertically in combination.
3. Jumpers must take precautions to prevent a collision with freefalling jumpers during and after opening.

H. CANOPY COLLISIONS

1. The best way to avoid a collision is to know where other canopies are at all times.
2. If approaching a jumper head on, both canopies should steer to the right.
3. If a collision is inevitable:
   a. Protect your face and operation handles.
   b. Spread your legs to avoid going between lines.
   c. Check altitude with respect to the minimum cutaway decision and execution altitude recommended for your experience.
   d. Communicate before taking action:
      (1) The jumper above can strike the jumper below during a cutaway unless one or both are clear or ready to fend off.
      (2) The jumper below can worsen the situation for the jumper above by cutting away before he or she is ready.
      (3) If both jumpers are cutting away and altitude permits, the second jumper should wait until the first jumper clears the area below.
      (4) The first jumper should fly from underneath in a straight line after opening.
      (5) At some point below a safe cutaway altitude (1,000 feet), it may become necessary to deploy one or both reserves (may not be a safe option with an SOS system).
      (6) If both jumpers are suspended under one flying canopy at a low altitude, it may become necessary to land with only that canopy.

I. LOW TURNS

1. Low turns under canopy are one of the biggest causes of serious injury and death in skydiving.
2. A low turn can be premeditated or result from an error in judgment or experience with a situation.
3. To avoid low turns, fly to a large, uncrowded landing area free of obstacles and—
   a. Into the intended DZ, fly a planned landing that promotes a cooperative traffic flow.
   b. If landing off-field, plan a landing pattern by 1,000 feet.
4. Once a jumper realizes that a turn has been made at an unsafe altitude:
   a. As soon as it is clear that the turn was started too low, stop the turn.
   b. Use toggle control to get the canopy back overhead.
   c. Prepare for a hard landing (PLF).
   d. Manage the speed induced by the turn.
      (1) Expect more responsive flare control with the toggles due to the increased airspeed.
      (2) Expect a longer, flatter flare.
   e. In case of premature contact with the ground, no matter how hard, keep flying the canopy to reduce further injury.
A. STUDENTS

1. All students who have not jumped in 30 days or more should receive refresher training:
   a. Review all standard procedures which were—or should have been—previously acquired.
      (1) physical skills
      (2) theoretical knowledge
   b. Practice emergency procedures in a harness simulator under the guidance of a rated USPA Coach, Instructor, or Instructor Examiner.
   c. A student should repeat reserve deployment training once each month until obtaining a USPA A License, including the use of a harness simulator and the pull of an actual reserve ripcord while in the training harness.

2. IAD or static-line method students on freefall status but not yet cleared for freefall self-supervision who have not jumped within the preceding 30 days should make at least one satisfactory jump in their initial training method, with a successful practice deployment, under the direct supervision of an appropriately rated USPA Instructor, before returning to freefall status.

3. IAD and static-line method students cleared to self-supervise in freefall but who have not jumped in the preceding—
   (1) 30 days: should make at least one jump under the direct supervision of a USPA Instructor until demonstrating altitude awareness, freefall control on all axes, tracking, and canopy skills sufficient for safely jumping in groups
   (2) 60 days: should follow the recurrency recommendations for IAD and static-line freefall students who have not yet been cleared for self-supervision in freefall

4. AFF students cleared to self-supervise in freefall but who have not jumped in the preceding 30 days should make at least one jump under the direct supervision of a currently rated AFF Instructor.

B. LICENSED SKYDIVERS

1. Skydivers returning after a long period of inactivity encounter greater risk that requires special consideration to properly manage.
2. Care should be taken to regain or develop the knowledge, skills, and awareness needed to satisfactorily perform the tasks planned for the jump.
3. Jumps aimed at sharpening survival skills should precede jumps with other goals.

A LICENSE

USPA A-license holders who have not made a freefall skydive within—

1. 60 days: should make at least one solo jump under the direct supervision of a currently rated USPA Instructor until demonstrating altitude awareness, freefall control on all axes, tracking, and canopy skills sufficient for safely jumping in groups
2. 90 days:
   a. if trained in the static-line or IAD method should make at least one satisfactory static-line or IAD jump with a practice deployment under the direct supervision of an appropriately rated USPA Instructor, and then follow recurrency recommendations for 60 days of inactivity
   b. if trained in the AFF method, should make at least one jump under the direct supervision of a currently rated AFF Instructor to demonstrate the ability to start and stop turns and maintain altitude awareness and stability during deployment, and then follow recurrency recommendations for 60 days of inactivity

B LICENSE

USPA B-license holders who have not made a freefall skydive within the preceding 90 days should make at least one jump under the direct supervision of a USPA Instructor until demonstrating the ability to safely exercise the privileges of that license.

C LICENSE

USPA C-license holders who have not made a freefall skydive within the preceding 120 days should make at least one jump under the direct supervision of a USPA Instructor until demonstrating the ability to safely exercise the privileges of that license.

D LICENSE

USPA D-license holders who have not made a freefall skydive within the preceding six months should make at least one jump under the direct supervision of a USPA Instructor until demonstrating the ability to safely exercise the privileges of that license.
C. Changes in Procedures

1. If deployment or emergency procedures are changed at any time, the skydiver should be thoroughly trained and practice under supervision in a harness simulator until proficient.

2. Ground training should be followed by a solo jump which includes several practice sequences and deployment higher than normal.

3. The jumper should repeat ground practice at short intervals, such as before each weekend's jump activities, and continue to deploy higher than normal until thoroughly familiar with the new procedures.
A. FEDERAL REGULATIONS ON EQUIPMENT

1. The design, maintenance and alteration of parachute equipment is regulated by the Federal Aviation Administration of the U.S. Department of Transportation which publishes Federal Aviation Regulations (FARs).

2. All skydivers should be familiar with the following FARs and their applicability to skydiving (see Section 9-1 and 9-2 of this manual):
   a. Part 65—Certification of Parachute Riggers
   b. Part 91—General Flight Rules
   c. Part 105—Parachute Operations
   d. Advisory Circular 105-2—explains in detail various areas of parachute equipment, maintenance, and modifications.

3. Approval of parachutes is granted to manufacturers in the form of Technical Standard Orders (TSOs).
   a. TSO C-23 is issued to parachutes that comply with the current performance standards.
      (1) NAS 804 for TSO C-23b
      (2) AS-8015A for TSO C-23c
      (3) AS-8015B for TSO C-23d
   b. These standards specify the tests that must be passed for a parachute system and its component parts to receive approval for civilian use.
   c. Procedures for obtaining TSO approval for parachutes or component parts may be found in FAR Part 21.

4. Alterations to approved parachutes may be performed by only those who have been issued an FAA approval for the alteration.
   a. Approval may be obtained by submitting a request and description of the alteration to the manufacturer or to an FAA Flight Standards District Office.
   b. The following are eligible to receive alteration approval:
      (1) FAA master rigger
      (2) manufacturer with an approved quality assurance program
   c. Alterations may not be performed without full documentation of FAA approval for the specific alteration.

B. MAIN PARACHUTE

1. Jumpers should choose canopies that will provide an acceptable landing in a wide range of circumstances, some of which may not be under their control.

2. Owners should verify with a rigger that all applicable updates and bulletins have been accomplished.

3. Jumpers should observe the recommendations of the canopy manufacturer for the correct canopy size, usually listed by maximum recommended weight or wing loading in pounds per square foot, with respect to other factors:
   a. the jumper’s experience
   b. drop zone altitude
   c. other conditions

4. Wing loading, measured as pounds (exit weight) per square foot, provides only one gage of a canopy’s performance characteristics.
   a. A smaller canopy at an equal wing loading to a larger one of the same design will exhibit more control response.
   b. Design, materials, and construction techniques can cause two equally wing-loaded canopies to perform very differently.

C. RESERVE PARACHUTE

1. All skydivers should use a steerable reserve canopy.

2. The FAA requires the reserve parachute assembly, including harness, container, canopy, risers, pilot chute, deployment device, and ripcord, to be approved.

3. Jumpers must observe FARs regarding the manufacturer’s maximum certificated weights and speeds for parachutes.
   a. Parachutes approved under FAA Technical Standard Order C-23b, C-23c, and C-23d are subject to different testing standards and operation limits.
   b. The entire parachute system is limited to the maximum certificated load limit of the harness-and-container system or reserve canopy, whichever is less.
   c. Load limits are found in the owner’s manual or placarded on the parachute component itself.

4. For a ram-air reserve, jumpers should not exceed the maximum suspended weight specified by the manufacturer (not necessarily the maximum certificated load limit).

5. By jumping at higher MSL altitudes or falling in vertical freefall orientations, a jumper can exceed the speeds for which a reserve is tested.

6. Round reserve canopy
   a. should be equipped with a deployment device to reduce the opening force and control deployment
   b. should have a rate of descent that does not exceed 18 feet per second (fps)
   c. must not exceed a rate of descent of 25 fps at sea level conditions (NAS 804)
d. The following scale indicates the minimum size round reserve canopy recommended for use according to the exit weight of the skydiver:

<table>
<thead>
<tr>
<th>Total Suspended Weight</th>
<th>Recommended Equivalent Descent Rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up to 149 pounds</td>
<td>24-foot</td>
</tr>
<tr>
<td>150 to 199 pounds</td>
<td>26-foot</td>
</tr>
<tr>
<td>200 pounds and over</td>
<td>28-foot</td>
</tr>
</tbody>
</table>

*The use of lower porosity materials can reduce the rate of descent.

D. HARNESs AND CONTAINER SYSTEM

1. The FAA requires the harness of a dual parachute assembly to be approved.
2. All harness ends should be folded over and sewn down or wrapped and sewn down to prevent the harness from unthreading through the hardware upon opening.
3. Canopy release systems should be maintained according to the schedule and procedures in the owner's manual.
4. It is desirable for the manufacturing industry to standardize the location of all operational controls.
5. The harness should be equipped with single-point riser releases (one handle releases both risers) for easy and rapid disengagement from the main canopy.
6. Reserve ripcord handles:
   a. Loop type handles should be made of metal.
   b. Plastic and composite reserve ripcord handles are not recommended.
   c. Jumpers should practice peeling and pulling pillow-type reserve ripcord handles until certain they can operate them easily in an emergency.
7. All ripcord housing ends should be secured.
8. Ripcord pins, when seated, should either be started inside the housing or clear the closing loop before entering the housing.
9. A ripcord cable stop should not be used; fatal accidents caused by reserve entanglements with ripcords secured in this manner have been documented.
10. Reserve pilot chute:
    a. The reserve system is usually designed to use a specific type of pilot chute.
    b. It should be properly seated in the container and repacked if it has shifted.

E. MAIN PILOT CHUTE

1. The main pilot chute is designed as part of the main parachute system.
   a. On throw-away hand-deployed systems, the pilot chute and pouch size must be compatible.
   b. Pilot chute size can affect the opening characteristics of the main canopy.
2. Collapsible hand-deployed pilot chutes add complexity and additional maintenance requirements to the system.

F. RESERVE STATIC LINE (RSL)

1. A reserve static line attaches to a main canopy riser to extract the reserve ripcord pin immediately and automatically after separation of the main risers from the harness.
2. An RSL is recommended for all experienced jumpers.
   a. The RSL backs up the jumper by extracting the reserve ripcord pin after a cutaway.
   b. The RSL—
      (1) must be routed and attached correctly to function
      (2) when misrouted, can complicate or prevent a cutaway
   c. RSLs can complicate certain emergency procedures:
      (1) cutaway following a dual deployment
      (2) cutting away from an entanglement after a collision
      (3) unstable cutaway, although statistics show that chances are better from an unstable reserve deployment than delaying after a cutaway
      (4) unstable cutaway with a helmet camera or other protruding device
      (5) cutaway with a surfboard (although an RSL may have prevented two fatal skysurfing accidents)
      (6) cutaway on the ground in high winds
      (7) broken riser on the RSL side (results in reserve deployment); prevention—
         (i) inspecting and replacing worn risers
         (ii) packing for soft openings (tight line stows; see manufacturer's instructions)
         (iii) stable deployment at slow speeds
3. When using a reserve static line device, the skydiver must not depend on the static line device and must manually pull the reserve ripcord immediately after the cutaway.
4. An RSL may not be desirable when attempting linked canopy formations.
5. Unless the manufacturer's instructions state otherwise, a connector device between the left and main risers should not be used.

G. AUTOMATIC ACTIVATION DEVICE (AAD)

1. An AAD initiates the reserve deployment sequence at a pre-set altitude (also sometimes used on the main parachute system).
2. An AAD is encouraged for all licensed jumpers.
3. The use of an AAD for activation of the reserve parachute, coupled with proper training in its use, has been shown to significantly increase the chances of surviving a malfunction.

4. The AAD is used to back up the jumper’s deployment and emergency procedures, but no jumper should ever rely on one.

5. The FAA requires that if an AAD is used, it must be maintained in accordance with the manufacturer's instructions (FAR 105.43.c).

6. Each jumper should read and understand the owner’s manual for the AAD he or she intends to use.

7. An AAD may complicate certain situations, particularly if the jumper deploys the main parachute low enough for the AAD to activate.

H. Static Line (Main)

1. The FAA requires static line deployment to be either by direct bag or pilot-chute assist.

2. The direct bag is a more positive method of static-line deployment because it reduces the chance of the student interfering with main canopy deployment.

3. The FAA requires an assist device to be used with static line deployment when rigged with pilot-chute assist.
   a. The assist device must be attached at one end to the static line so that the container is opened before the device is loaded, and at the other end to the pilot chute.
   b. The FAA requires the pilot chute assist device to have a load strength of at least 28 but not more than 160 pounds.

4. The static line should be attached to an approved structural point of the airframe.
   a. A seat belt attachment point is considered part of the airframe, but the static line should pull on it in a longitudinal direction.
   b. Aircraft seats are not considered to be part of the airframe.

5. A static line should be constructed:
   a. with a length of at least eight feet but not more than 15 feet and should never come into contact with the aircraft’s tail surfaces
   b. with a locking slide fastener, ID number 43A9502 or MS70120
   c. with webbing of not less than 3,600 pounds tensile strength
   d. when used with a pin assembly—
      (1) should withstand a pull of 300 pounds
      (2) should be attached to the webbing in such a manner that the attachment and cable will withstand a pull of 600 pounds

I. Borrowing or Changing Equipment

1. Parachutes should not be rented or loaned to persons unqualified to carry out an intended skydive or to persons of unknown ability.

2. The use of unfamiliar (borrowed, new) equipment without sufficient preparation has been a factor in many fatalities.

3. Equipment changes:
   a. Changes in type of equipment should be avoided or minimized whenever possible during student training.
   b. When changes are made, adequate transition training should be provided.

4. When jumping a new or different main parachute, a jumper should follow the canopy familiarization progression outlined in Categories A-H of the Integrated Student Program (multiple jumps).

J. Use of Altimeters

1. Skydivers must always know their altitude.

2. There is a great reduction of depth perception over water and at night.

3. Pull altitude and other critical altitudes should be determined by using a combination of visual reference to the ground and to an altimeter.
   a. As a primary reference, each skydiver should learn to estimate critical altitudes (break-off, minimum deployment, minimum cutaway) by looking at the ground and mentally keeping track of time in freefall.
   b. Altimeters provide excellent secondary references for developing and verifying primary altitude recognition skills.
   c. Some jumpers may desire more than one altimeter and even more than one altimeter of the same type to have a reference available throughout the jump.
   d. Jumpers should wear their altimeters so they are available to them during as many phases of the jump as possible.

4. Some examples of altimeter types and locations include:
   a. visual altimeter worn on the wrist
      (1) easy to read in a variety of freefall positions
      (2) wrist is usually unaffected by burbles
      (3) difficult to read while tracking
   b. visual altimeter worn on the chest
      (1) reference for others in a group, particularly when belly flying
      (2) readable during tracking
      (3) subject to error and erratic readings while back-to-earth
   c. audible altimeter, typically worn against the ear
      (1) Audibles provide a good reference to key altitudes near the end of the planned freefall.
      (2) Extreme background noise of freefall and a jumper’s attention to another event can render audible altimeters ineffective.
      (3) Students should use audible altimeters only after demonstrating a satisfactory level of altitude awareness.
5. Initial and refamiliarization training for altimeter use should include:
   a. Look at the ground.
   b. Look at the altimeter and note the altitude.
   c. Repeat this procedure several times per jump to develop the ability to eyeball the altitude.

6. Altimeter errors
   a. Altimeters use electronic and mechanical components that are subject to damage and may fail in use.
   b. Minor differences in indicated altitude are to be expected.
   c. Set the altimeter at the landing area and do not readjust the altimeter after leaving the ground.
   d. An altimeter may lag during both ascent and descent; plus or minus 0-500 feet is to be expected.
   e. The needle can stick during both ascent and descent—a visual cross reference with the ground should be used in combination with the altimeter.
   f. When the altimeter is in a burble (as when falling back-to-earth), it may read high by as much as 1,000 feet.

7. Handle altimeters with care and maintain and store them according to the manufacturer's instructions.

K. ACCESSORIES

1. The use of personal equipment should be determined by the type of jump experience and proficiency of the skydiver, weather, and drop zone conditions.

2. Clothing and equipment:
   a. Adequate protective clothing, including jumpsuit, helmet, gloves, goggles, and footwear should be worn for all land jumps.
   b. Gloves are essential when the jump altitude temperature is lower than 40° F.
   c. A jumper should always carry a protected but accessible knife.
   d. A rigid helmet—
      (1) should be worn on all skydives (tandem students may wear soft helmets)
      (2) should be lightweight and not restrict vision or hearing
   e. All jumpers are advised to wear flotation gear when the intended exit, opening, or landing point of a skydive is within one mile of an open body of water (an open body of water is defined as one in which a skydiver could drown).

L. MAIN PARACHUTE PACKING

1. The main parachute of a dual assembly may be packed by—
   a. an FAA rigger
      (1) An FAA rigger may supervise other persons in packing any type of parachute for which that person is rated (FAR 65.125.a and b).
      (2) A non-certificated person may pack a main parachute under the direct supervision of an FAA rigger (FAR 105.43.a).
   b. the person who intends to use it on the next jump (FAR 105.43.a)

2. Packing knowledge:
   a. Each individual skydiver should have the written approval of an S&TA, USPA Instructor, I/E, or an FAA rigger.
   b. All parachute packers should know and understand the manufacturer's instructions for packing, maintenance, and use.

3. Tandem main parachutes may be packed by (FAR 105.45.b.1)—
   a. an FAA rigger
   b. the parachutist in command making the next jump with that parachute
   c. a packer under the direct supervision of a rigger

4. Temporary packing pins should be used for parachute packing only when they are individually marked with a large strip of red cloth or tied together and then attached to the packing table or mat.

M. PARACHUTE MAINTENANCE

1. Inspection:
   a. The equipment owner should frequently inspect for damage and wear.
   b. Any questionable condition should be promptly corrected.
   c. Detailed owner inspection of the parachute is outlined in the Equipment Section of Category G of the USPA Integrated Student Program, SIM Section 4.

2. Maintenance and repair of the reserve:
   a. The FAA requires the entire reserve assembly to be maintained as an approved parachute.
   b. Repairs to the reserve assembly must be done by an FAA-certificated parachute rigger.

3. Maintenance and repair of the main:
   a. Repairs to the main may be done by an FAA-certificated rigger or by the owner if he or she has adequate knowledge and skill.
   b. The main parachute and its container need not be maintained as “approved.”

4. Major repairs and alterations may be performed only by or under the supervision of:
   a. an FAA master rigger
   b. the parachute manufacturer
   c. any other manufacturer the FAA considers competent
PRE-JUMP SAFETY CHECKS AND BRIEFINGS

A. Equipment Preparation is Essential

1. Preparing all skydiving equipment and procedures prior to each jump is critical to preventing accidents.

2. This information is intended to provide the instructional staff and other experienced jumpers with a reference to use as guidance in developing a personal checklist appropriate to the procedures and equipment in use.

3. In some cases, these checks will be the principal responsibility of others—the pilot, instructor, coach, rigger, jumpmaster, ground crew chief, etc., however, no one should assume that these responsibilities have been carried out by others.
   a. Initially, the USPA Instructor performs these pre-jump safety checks and briefings for his or her students.
   b. As the student progresses, he or she should begin to learn to do them.
   c. Through leadership and attitude, the instructional staff has the opportunity to foster a respect for safety which will serve the beginning skydiver well when assuming sole responsibility for all of his or her skydiving activities.

4. Students progressing through the training program and all experienced jumpers should review all of the items on these lists to familiarize themselves with the wide range of details.

5. This section includes checklists for:
   a. aircraft preflight
   b. ground crew briefing
   c. pilot briefing
   d. skydiver briefing
   e. equipment check
   f. before-takeoff check
   g. takeoff
   h. spotting
   i. jump run
   j. descent and landing in aircraft
   k. post-jump debriefing

B. Briefings

1. Aircraft preflight (primarily the responsibility of the pilot, but the jumpmaster or supervising USPA instructional rating holder should check also):
   a. placards: in place (as required)
   b. seats removed (as required)
   c. door stop (under Cessna wing) removed
   d. sharp objects taped
   e. loose objects secured
   f. steps and handholds secure, clean of oil
   g. aircraft altimeter set
   h. filing and activation of notice to airmen (NOTAM)
   i. aircraft radio serviceable
   j. static-line attachment secure
   k. knife in place and accessible
   l. remote spotting correction and communication signals operational (larger aircraft)
   m. winds-aloft report or wind-drift indicators available
   n. seat belts available and serviceable
   o. passenger hand straps near door removed

2. Ground crew briefing: The jumpmaster should coordinate to ensure that everyone is in agreement:
   a. communications procedures to meet BSR requirements for ground-to-air communication: smoke, panels, radio, etc.
   b. jump order
   c. distance between groups on exit
   d. landing pattern priorities
   e. control of spectators and vehicles
   f. student operations (USPA Instructor)
      (1) wind limitations
      (2) setting up and maintaining a clear target area
      (3) critiques of student landings
      (4) maintenance of master log
      (5) accident and first-aid procedures

3. Pilot briefing: The jumpmaster coordinates with the pilot:
   a. jump run altitudes
   b. jump run direction
   c. communications (ground to air, jumpmaster to pilot, air traffic control)
   d. aircraft attitudes during corrections on jump run
   e. jump run speed and cut
   f. locking wheel brake (if applicable), but the parking brake is not to be used
   g. gross weight and center of gravity requirements and limitations
   h. procedures for aircraft emergencies
   i. procedures for equipment emergencies in the aircraft

4. Skydiver briefing:
   a. conducted by the load organizer
      (1) seat belt off altitude: 1,500 feet or DZ policy
      (2) movement in the aircraft, especially during jump run
      (3) aircraft emergency procedures, including communication procedures
      (4) parachute equipment emergency procedures
   b. to be conducted by the USPA Instructor:
      (1) review of student log or record
(2) jump plan
   (i) exit and freefall, including jump commands
   (ii) emergency procedure training or review
   (iii) canopy control and landing pattern
   (iv) drop zone appearance and hazards (an aerial photo or map is recommended)
(3) protection of operation handles and pins
(4) conduct in aircraft: mental preparation and movement

C. EQUIPMENT CHECKLIST

1. Equipment check responsibilities before boarding and before exiting:
   a. The USPA Instructor or Coach checks the student's equipment.
   b. Each individual skydiver ensures that his or her own equipment is inspected.

2. Checklist
   a. helmet: proper fit and the chin strap threaded correctly
   b. goggles or glasses secure and clean
   c. canopy releases: properly assembled and periodic maintenance performed
   d. reserve static line (RSL) hooked-up and routed correctly (refer to manufacturer's instructions)
   e. altimeters checked and set and visual altimeters do not block operation handles
   f. main parachute
      (1) main canopy properly sized
      (2) container properly closed, pull-up cord removed, and closing loop in good condition
      (3) activation device
         (i) ripcord: secure in the pocket, housing tacked and secured on both ends, movement of the pin or cable in the housing and closing loop, and pilot chute seated correctly
         (ii) throw-out pilot chute: secure in the pouch, bridle routed correctly and secure, pin secure on the bridle and seated in the closing loop, and slack above the pin (some rigs; see manufacturer's instructions)
         (iii) pull-out pilot chute (not approved for student use) handle secure: pin seated, free movement of the handle through pin extraction (see manufacturer's instructions)
      (4) practice main deployment handle secure (student)
   g. harness:
      (1) straps not twisted and routed correctly
         (i) chest strap
         (ii) leg straps
         (iii) belly band, if applicable
   h. belly band (if used):
      (1) correctly routed
      (2) adjusted
      (3) friction adapter properly threaded
   i. reserve:
      (1) proper size for jumper
      (2) pin condition—seated, not bent, and closing loop(s) in good condition
      (3) pilot chute seated
      (4) packing data card in date and seal in place
      (5) ripcord handle pocket condition
      (6) pin cover flap closed
      (7) overall appearance
   j. risers not twisted and toggles secure
   k. suspension and control lines not exposed
   l. static line (students):
      (1) correct length, routing, and slack for operation compatible with that aircraft
      (2) assist device (if required) attached properly
      (3) static-line secured to prevent premature deployment
      (4) closing pin or cable in place
   m. personal:
      (1) footwear—proper type and fit, no open hooks or buckles
      (2) protective clothing
         (i) jumpsuit pockets closed
         (ii) other outerwear compatible with jumping
         (iii) gloves as required
      (3) no unnecessary accessories, such as cameras
      (4) empty pockets
   n. automatic activation device (AAD):
      (1) serviced according to manufacturer's schedule
      (2) calibrated for jump (if required)
      (3) proper routing of cable(s)
      (4) control unit secured in proper location
      (5) armed or turned on as required
   o. radio (students) properly secured and functional (test with base station)
   p. condition of all touch fastener (velcro) and tuck tabs
   q. overall fit and appearance
WEATHER

A. Determining Winds

1. Surface winds must be determined prior to jumping and should be measured at the actual landing area.

2. Winds aloft:
   a. Winds aloft reports available from the FAA flight service are forecasts only.
   b. Observations may be made while in flight using navigation systems, for example, global positioning satellite systems (GPS).
   c. Winds can change at any time, so all available information should be checked by the jumper before and during the jump.

B. Hazardous Weather

1. Fronts approach with much warning but can catch the unaware off guard.
   a. Some fronts are preceded by a gust front, a line of sudden and severe weather.
   b. Frontal approach and passage may be associated with rapid and significant changes in the strength and direction of the winds aloft and on the surface.

2. On calm, hot, humid days, thunderstorms can spontaneously generate and move in unpredictable patterns.

3. Dust devils are mini-tornadoes that spontaneously generate on days of high thermal convection activity.

4. Where to get practical information on approaching weather:
   a. the Weather Channel
   b. www.weather.com
   c. TV weathercasts
   d. pilot assistance (legally responsible to know the weather conditions before flight)
   e. continuous observation

C. Density Altitude

1. Parachute performance is measured at sea level in moderate temperatures and humidity.

2. Altitude, heat, and humidity influence the density of air.

3. Density altitude is a measure of air density that is calculated according to the temperature and altitude.

4. The efficiency of a wing is reduced approximately ten percent for every 3,000 feet of increase in density altitude:
   a. higher stall speed
   b. faster forward speed
   c. faster descent rate
   d. higher opening forces

5. Additionally, aircraft are affected by higher density altitude in the following ways:
   a. longer distances required for takeoff and landing
   b. reduced propeller effectiveness
   c. poorer turbine and piston engine performance
   d. slower and flatter rate of climb

6. The aircraft pilot is responsible to know the density altitude prior to takeoff, and skydivers are advised to consider the effects of density altitude on canopy performance.
1. Skydivers play a more integral role in aircraft operations than ordinary passengers, because their procedures can dramatically affect the controllability of the aircraft, particularly during exit.
   a. Parasitic drag reduces airspeed necessary for flight and reduces the effectiveness of control surfaces.
   b. Excess weight in the rear of the aircraft can cause the pilot to lose control.
2. All jumpers should be briefed by a jump pilot on the topics outlined in Aircraft Briefing from Category E of the USPA Integrated Student Program (SIM Section 4).
3. The smallest aircraft which should be used for student jumping is one which will carry the pilot and at least three jumpers.
4. High openings
   a. The pilot and all jumpers on board the aircraft should be informed in advance whenever an opening is planned to be above the normal opening altitude (generally 5,000 feet and lower).
   b. When more than one aircraft is being used, the pilots of each aircraft in flight at the time of the jump should be notified.
5. Aircraft fueling
   a. Aircraft fueling operations should occur away from skydiver landing and loading areas, and no person, except the pilot and necessary fueling crew, should be aboard the aircraft during fueling.
   b. USPA accepts the practice of rapid refueling (fueling an aircraft while an engine is running) for certain turbine-powered aircraft when performed in accordance with the guidelines of Parachute Industry Association Technical Standard, TS-122.
6. Entering the aircraft
   a. Students should never approach an aircraft, whether the engine is running or not, unless they are under the direct supervision of a USPA Instructor or Coach.
   b. Everyone should always approach a fixed-wing aircraft from behind the wing and always approach a helicopter from the front.
   c. Everyone should always protect his or her ripcord handles while entering the aircraft and follow procedures to avoid the accidental activation of any equipment.
7. Everyone on board the aircraft is subject to the seating requirements found in FAR 91.107 and the parachute requirements found in FAR 91.307.
8. When not in use, seat belts should be stowed out of the way, but they should never be fastened together unless they are being worn.
9. All pilots and other occupants of a jump aircraft must wear parachutes when required by the FAA.
A. **WHY SPOTTING IS IMPORTANT**

1. Choosing the correct exit point and guiding the pilot to it (spotting) helps fulfill each skydiver’s responsibility to land in an appropriate clear area.

2. Jumpers must demonstrate basic spotting abilities prior to obtaining the USPA A license.

3. Spotting in more difficult circumstances requires continued practice and study.

4. In addition to considerations for getting one jumper or group out of the aircraft at the correct point, spotters must consider the correct exit points for multiple individuals or groups on the same pass from a larger aircraft.

B. **PRIORITIES**

1. Be familiar with the DZ and surrounding area, including exit and opening points.
   a. Jumpers should observe and talk to those on previous jumps to help determine the correct jump-run direction and exit and opening point.
   b. Methods for estimating the exit and opening point based on winds-aloft forecasts are explained in the Aircraft and Spotting sections of Categories F and G of the Integrated Student Program, Section 4 of this manual.
   c. A wind-drift indicator (WDI) is effective for determining drift under canopy.
      (1) A piece of weighted crepe paper is released at canopy opening altitude over an observed position.
      (2) The jumpers aboard the aircraft observe the drift of the WDI to determine the distance and direction of the best opening point upwind of the target.
      (3) Jumpers should be responsible for wind drift indicators after they land.
      (4) Observation and calculation of the spot from the winds-aloft report have replaced the WDI for most routine drop zone operations.

2. Look out of the aircraft.
   a. for traffic below
   b. for clouds
   c. to spot

3. Identify the DZ, the climbout point, and exit point from the open door of the aircraft.

4. Techniques for determining the point straight below the aircraft are discussed in Category D of the ISP.

C. **GROUP SEPARATION ON JUMP RUN**

1. Slower-falling jumpers and groups are exposed to upper headwinds longer and are blown farther downwind than faster-falling jumpers and groups.
   a. Slower-falling groups should exit before faster-falling groups if jump run is flown into the wind.
   b. On days with strong upper headwinds, allow more time between groups on the same pass to get sufficient horizontal separation over the ground.
      (1) Provide at least 1,000 feet of ground separation between individuals jumping solo.
      (2) Provide at least 1,500 feet of ground separation between small groups, adding more as size of the groups increases.

2. Flying jump run across the upper winds (crosswind) helps achieve separation between groups.
section six

ADVANCED PROGRESSION

Section Summary:

Completing the basic instruction and earning a license presents many new opportunities for advanced progression in skydiving. Advancement in one or more of the areas discussed in this section will help to improve your skills and increase your enjoyment and satisfaction from the sport.

Information in this section provides guidance for night jumping, water landings, canopy formation, high altitude jumps, flying a camera, and jumping wingsuits.

These guidelines will also assist you in meeting your skill and knowledge requirements for the USPA B, C, and D licenses and USPA ratings.

Important Reference Numbers

- group freefall—6-1
- freeflying, freestyle, and skysurfing—6-2
- rate of descent and time table—6-3
- night jumps—6-4
- water landings—6-5
- canopy formation—6-6
- high altitude jumps and oxygen use—6-7
- camera flying—6-8
- wing suits—6-9

Who needs this section?

- jumpers planning to engage in new types of skydiving activities
- jumpers planning extraordinary skydives
- jumpers working on advanced USPA licenses and ratings
- USPA Instructors conducting night and water jump briefings
- USPA officials advising jumpers on extraordinary skydives
A. **What is Relative Work?**

1. Group skydiving, traditionally called “relative work,” may be described as the intentional maneuvering of two or more skydivers in proximity to one another in freefall.

2. The concept of group skydiving is the smooth flow and grace of two or more jumpers in aerial harmony.
   a. Mid-air collisions and funneled formations are not only frowned upon but can be dangerous.
   b. The colliding of two bodies in flight can cause severe injuries or death.
   c. The greatest danger exists when jumpers lose sight of each other and open independently, which sets the stage for a jumper in freefall to collide with an open canopy.
   d. Even after opening, there is the possible danger of canopy collisions if proper safety procedures are not followed.

B. **Training and Procedures**

1. Before training for group freefall, each student should complete all the training and advancement criteria through Category F of the USPA Integrated Student Program, Section 4 of this manual.

2. Initial training for group freefall skills should begin as soon as the student completes Category F of the ISP—
   a. to maintain interest in skydiving
   b. to encourage relaxation in the air
   c. to develop coordination
   d. to establish participation in group activities
   e. to encourage the development of safe attitudes and procedures

3. Initial training should begin with no more than two jumpers—the trainee and a USPA Coach or higher rating holder.

4. A recommended training outline for beginning group freefall skills is included in Categories G and H of the ISP.

C. **Breakoff**

1. The minimum breakoff altitude should be—
   a. for groups of five or fewer, at least 1,500 feet higher than the highest planned deployment altitude in the group (not counting one camera flyer)
   b. for groups of six or more, at least 2,000 feet higher than the highest planned deployment altitude in the group (not counting a signaling deployment or camera flyers)
   c. higher than these recommendations for the following:
      1. groups with one or more jumpers of lower experience
      2. jumpers with slower-opening or faster-flying canopies
      3. jumpers engaging in freefall activities that involve a fall rate faster than belly to earth terminal velocity
      4. jumps involving props, toys, or other special equipment, (signs, banners, smoke, flags, hoops, tubes, items released in freefall, etc.)
      5. other special considerations

2. At the breakoff signal or upon reaching the breakoff altitude, each participant should:
   a. turn 180-degrees from the center of the formation
   b. flat track away (flat tracking will achieve more separation than diving)

3. Opening:
   a. The pull should be preceded by a distinct wave-off to signal jumpers who may be above.
   b. During the wave-off, one should look down and to the sides to ensure that the area is clear.
   c. The low person has the right-of-way, both in freefall and under canopy.

D. **Other References**

1. See SIM Section 6-2, “Freeflying, Freestyle Skydiving, and Skysurfing Recommendations” for information about group flying in vertical orientations.

2. See SIM Section 6-4, “Night Jump Recommendations” for guidance on jumping in groups at night.
A. THE SCOPE OF FREEFLYING

1. These recommendations provide guidance for vertical freefall body positions which may result in significantly higher fall rates and rapid changes in relative speed.

2. The diverse freefall speeds among jumpers engaged in different freefall activities affect separation between individuals and groups exiting on the same pass over the drop zone.

3. The term “freeflying” in this context is applied to all activities that incorporate standing, head-down, or sitting freefall positions, including freestyle and skysurfing.

B. QUALIFICATIONS

1. Before engaging in freeflying, the skydiver should hold a USPA A license.

2. The skydiver should have demonstrated sufficient air skills, including:
   a. consistent altitude awareness
   b. basic formation skydiving skills
   c. ability to track to achieve horizontal separation
   d. understanding of the jump run line of flight
   e. proficiency in movement up, down, forward, backward, and rotation in a sit position before attempting standing or head-down maneuvers

C. EQUIPMENT

1. One must keep in mind that unless the gear is properly secured, the chances of a premature deployment of either canopy increase.
   a. A premature opening at the speeds involved in this type of skydiving could result in severe injury to the body or stressing the equipment beyond limits set by the manufacturers.
   b. Deployment systems and operation handles should remain secure during inverted and stand-up flight; therefore, equipment for freeflying should include:
      (1) bottom-of-container mounted throw-out pilot chute pouch, pull-out pilot chute, or ripcord main deployment system
      (ii) Exposed leg-strap-mounted pilot chutes present an extreme hazard.
      (ii) Any exposed pilot chute bridle presents a hazard.
      (2) closing loops, pin protection flaps, and riser covers well maintained and properly sized

2. Harness straps
   a. Leg straps should be connected with a seat strap to keep the leg straps from moving toward the knees while in a sitting freefall position or making transitions.
   b. Leg and chest straps should be tightly stowed.

D. TRAINING

1. Freeflying has many things in common with face-to-earth formation skydiving.
   a. A beginner will progress much faster and more safely with a coach.

2. Prior to jumping with larger groups, progress should follow the same model as for the freefall and canopy formation disciplines: 2-way formations of novice and coach to develop exit, body position, docking, transition, and breakoff skills.

E. HAZARDS ASSOCIATED WITH GROUP FREEFLYING

1. Inadvertently transitioning from a fast-falling body position to a face-to-earth position (“corking”) results in rapid deceleration from typically 175 mph to 120 mph.
   a. Freeflying in a group requires the ability to:
      (1) remain in a fast-flying position at all times
      (2) remain clear of the airspace above other freeflyers
   b. Assuming a fast-falling position when the other skydivers are in a slow-falling position puts the freeflyer below the formation, creating a hazard at break-off.

2. Freeflying offers more potential for loss of altitude awareness than traditional skydiving for several reasons.
   a. Higher speeds mean shorter freefalls.
      (1) Face-to-earth freefall time from 13,000 feet to routine deployment altitudes takes about 60-65 seconds.
      (2) Typical freefall times from 13,000 feet may be as short as 40 seconds.
b. Head-down and sit-fly positions present a different visual picture of the earth; freeflyers may not be visually aware of their altitude.

c. Visual altimeters can be difficult to read in some body positions.

d. Audible altimeters can be hard to hear in the higher wind noise associated with freefly speeds.

e. As with other skydiving disciplines, participants must guard against focusing on an unimportant goal and losing track of the more important aspects of the skydive: time and altitude.

3. Horizontal drift

a. Novice freeflyers sometimes drift laterally in freefall.
   (1) An experienced coach can correct the problem.
   (2) On solo jumps, freeflyers should practice movement perpendicular to the line of flight (90 degrees to jump run heading).
   (3) Separation from other groups can be enhanced by tracking perpendicular to the line of flight at a routine breakoff altitude.

b. Experienced freeflyers must also be aware of lateral movement when coaching novices or performing dives involving horizontal movement.

c. All skydivers on loads mixing freeflyers and traditional formation skydiving must consider the overall effect of the wind on their drift during freefall.

d. As a general rule, faster-falling groups should leave after slower-falling groups particularly when jump run is flown against a strong headwind.

4. Faster-falling groups should delay canopy flight downwind and remain in position to allow jumpers who exited before them, but who fell slower, to deploy and then turn downwind also.

5. Loss of visual contact with other skydivers:

a. The rapid changes in vertical separation that can occur in freely positions makes it easy to lose contact with others on the dive.

b. Even jumpers with extensive experience in formation skydiving may have trouble locating everyone on a freefly dive.

c. Breakoff can be more confusing than usual.

d. Important considerations in planning a freefly dive are:
   (1) Keep the size of the groups small until proficient.
   (2) Plan higher breakoffs than usual.
   (3) Transition from fast-fall rate to normal tracking for separation gradually in case of a skydiver above the formation in a high-speed descent.
   (4) Avoid maneuvers near breakoff that increase vertical separation.
   (5) It is as important to slow down after breakoff as it is to get separation from other jumpers.
A. A LOGGING AID
1. The following table will assist in estimating the approximate amount of freefall time to be expected from a given altitude and in logging the correct amount of freefall time for a given jump.
2. Each skydiver should log every jump made, including the amount of freefall time experienced.
3. The amount of freefall time logged for each jump should be actual time.

B. COMPUTATION
1. Many factors affect the rate of fall or terminal velocity in freefall.
   a. total weight of the jumper including equipment
   b. the surface area-to-weight ratio (physical build)
   c. jumpsuit size
   d. altitude above sea level (air density)
   e. skydiving discipline, e.g., vertical orientations
2. The chart lists freefall times for three different terminal velocities, based on a belly-to-earth orientation, and provides an exit altitude reference for 2,500-foot openings.
3. To determine the approximate amount of freefall time to expect on a jump and to log a realistic amount of freefall time for a jump, use the following procedures:
   a. Determine your approximate terminal velocity by taking actual measurements of jumps with known exit and opening altitudes (this can be done by timing video tapes, by having someone on the ground time the skydive, or using a recording altimeter).
   b. Subtract your opening altitude from your exit altitude to determine the length of your freefall.
   c. Use the chart to estimate your freefall time according to your approximate terminal velocity and the distance in freefall.

freefall time table
SECTION 6-3—
FREEFALL RATE OF DESCENT AND TIME TABLE

TIME OF FREEFALL (WITH GIVEN TERMINAL VELOCITY)
a. 120 mph (176 feet per second) terminal velocity, based upon 45 pounds of equipment and a tight jumpsuit.
b. 109 mph (160 feet per second) terminal velocity, based on 20 pounds of equipment and a tight jumpsuit
c. 98 mph (144 feet per second) terminal velocity, based on 30 pounds of equipment and a large-winged jumpsuit
A. Why Jump at Night?

1. Night jumps can be challenging, educational, and just plain fun, but they require additional pre-training and increased care.

2. Night jumping not only places increased requirements on the jumper, but also the pilot, spotter, and ground crew.

3. As with all phases of skydiving, night jumping is made safe through:
   a. special training
   b. suitable equipment
   c. pre-planning
   d. good judgment

4. Every skydiver, regardless of experience, should participate in night-jump training to learn or review:
   a. techniques of avoiding disorientation
   b. use of identification light, lighted instruments, and flashlight
   c. target lighting
   d. ground-to-air communications
   e. reserve activation

5. To maintain safety and comply with FAA Regulations, any jumps between sunset and sunrise are considered as night jumps.

6. Night jumps to meet license requirements and to establish world records must take place between one hour after official sunset and one hour before official sunrise.

B. Qualifications

1. Skydivers participating in night jumping should possess a currently valid USPA B or higher license.

2. Participants should complete a comprehensive briefing and drill within 60 days before the intended night jump.
   a. The training should be conducted by a Safety & Training Advisor (S&TA), Instructor Examiner, or USPA Instructor.
   b. The training (including the date and location) should be documented in the jumper’s logbook and signed by the S&TA, I/E, or USPA Instructor.

C. Challenges

1. Night jumps provide the challenge of a new and unusual situation that must be approached with caution because of:
   a. the opportunity for disorientation
   b. the new appearance of the earth’s surface and the lack of familiar reference points
   c. hypoxia (oxygen deprivation) and visual impairment
      1. The visual senses are greatly impaired by darkness and reduction of depth perception.
      2. One of the first effects of hypoxia, evident as low as 7,000 feet, is loss of night vision.
      3. It takes approximately 30 minutes to recover from the effects of hypoxia.
      4. Smokers suffer the effects of hypoxia sooner than non-smokers.
      5. Be thoroughly familiar with night vision and hypoxia problems.
   d. night vision: requires 30 minutes to fully adjust

2. A jumper’s own shadow cast by the moon can resemble another jumper below and cause confusion.

3. Skydivers infrequently make night jumps, and are less familiar with and less proficient in handling themselves under the conditions of this new environment.

4. Since the skydiver cannot perceive what is taking place as rapidly and easily as in daylight, it takes more time to react to each situation.

D. Special Equipment

1. A light visible for at least three statute miles displayed from opening until the jumper is on the ground (an FAA requirement for protection from aircraft)

2. Lighted altimeter (recommended)

3. Clear goggles (recommended)

4. Jumper manifest (essential)

5. Flashlight (to check canopy)

6. Sufficient lighting to illuminate the target
   a. Lighting can be provided by flashlights, electric lights, or such devices.
   b. Road flares or other pyrotechnics and open flames can be extremely hazardous and should not be used.
   c. Automobiles can be used for lighting, but they clutter the landing area.

E. Procedures

1. General
   a. Night jumps should be conducted in weather conditions of light winds and good visibility.
   b. advice and notification
      1. Consult the local S&TA or a USPA Instructor Examiner for advice for conducting night jumps (required by the BSRs).
      2. Notify FAA, state, and local officials as required.
   c. Use a topographical map or photo with FAA Flight Service weather information for appropriate altitude and surface winds to compute jump run compass heading and exit and opening point.
d. One senior member should be designated jumpmaster for each pass and be responsible for accounting for all members of that pass once everyone has landed.

2. Target configuration for accuracy:
   a. Arrange lights in a circle around the target area at a radius of 25 meters from the center.
   b. Remove three or four of the lights closest to the wind line on the downwind side of the target and arrange them in a line leading into the target area.
      (1) This will indicate both wind line and wind direction.
      (2) By following a flight path over this line of lights, the jumper will be on the wind line and land upwind.
   c. Place a red light at dead center, protected by a plexiglass cover flush with the surface.

3. Emergency: Extinguish all lights in the event of adverse weather or other hazardous jump conditions to indicate "no jump."

4. Ground-to-air radio communications should be available.

5. Night Spotting:
   a. Current wind information for both surface and aloft conditions is critical at night.
   b. Spotters should familiarize themselves with the drop zone and surrounding area in flight during daylight, noting ground points that will display lights at night and their relationship to the drop zone and any hazardous areas.
   c. The spotter should plan to use both his or her own visual spotting and aircraft instruments to assure accurate positioning of the aircraft.
   d. Climb to altitude:
      (1) Conduct an orientation to familiarize each jumper with the night landmarks surrounding the drop zone.
      (2) Several methods are available for determining drift and the best opening point.
         (i) wind-drift indicator
         (ii) winds-aloft report

F. General

1. A jumper making a first night jump should exit solo (no group skydiving).

2. Strobe lights are not recommended for use in freefall, because they can interfere with night vision and cause disorientation.
   a. Constant lights are preferable.
   b. Flashing lights can be used once the jumper has opened and is in full control under canopy.

3. Warning on pyrotechnics:
   a. Road flares and other pyrotechnics exude hot melted chemicals while burning and are hazardous when used by skydivers in freefall.
   b. In addition, the bright glare greatly increases the possibility of disorientation.

G. Group Jumps: Freefall and Canopy

1. Freefall
   a. It is recommended that night relative work be planned for a full moon.
   b. Skydivers should wear white or light colored jumpsuits.
   c. A safe progression from a two-way to larger formations should be made on subsequent night jumps.

2. Canopy formations at night should be undertaken with extreme care and with a progression similar to that of night freefall group flying.
   a. It is recommended that night canopy formation activity be performed during a full moon.
   b. Brightly colored clothing should be worn by jumpers with dark-colored canopies.
   c. Strobes are not recommended, as they interfere with night vision and depth perception; instead, constant beam lights are preferred.
A. Why jump in the water?

1. In the early years, a number of fatalities resulted from accidental water landings, usually due to the absence of flotation gear, the use of less maneuverable parachutes, use of incorrect procedures, and landing in extremely cold water.

2. Water landing training is recommended to improve chances for survival from both intentional and unintentional water landings.

3. The purpose of wet training (B-license requirement) is to expose the individual to a worst-case-scenario in a controlled situation.
   a. Drownings are usually brought on by panic.
   b. Proper training should decrease the likelihood of panic and therefore decrease the likelihood of a drowning.

4. The potential always exists for unintentional water entry due to spotting error, radical wind changes, malfunctions, and landing under a reserve rather than a main.

5. Intentional water jumps are preplanned jumps into a body of water.
   a. A water jump can be the easiest and safest of all skydives provided normal procedures and a few additional precautions are employed.
   b. Physical injuries and drownings are almost unknown on preplanned, intentional water landings.

6. These recommendations provide the S&TA, Instructor Examiner, and USPA Instructor with guidelines to train skydivers to effectively deal with water hazards.

7. This section covers recommendations, procedures, and references for the following:
   a. training considerations for unintentional water landings
   b. wet training for water landings, both unintentional and intentional
   c. intentional water jumps

B. Training for Unintentional Water Landings

1. In the USPA Integrated Student Program, training recommendations for unintentional water landings are included in the obstacle landing training of Category A (the first-jump course).

2. A more complete and detailed briefing outline is contained in SIM Section 5-1.F.

Dry (theoretical training)

1. This training (including the date and location) should be documented in the student's logbook and A-License Proficiency Card or on a separate statement and signed by an S&TA, I/E, or USPA Instructor.

2. Theoretical training should include classroom lessons covering:
   a. techniques for avoiding water hazards
   b. how to compensate for poor depth perception over water
   c. preparation for water entry
   d. recovery after landing

3. Practice should combine both ground and training harness drills and should continue until the jumper is able to perform the procedures in a reasonable amount of time.

Wet (practical training)

1. Wet training
   a. should be conducted following a class on theory
   b. should take place in a suitable environment such as a swimming pool, lake, or other body of water at least six feet deep
   c. meets the USPA B license training requirements for intentional water landings

2. This training (including the date and location) should be documented in the jumper's logbook and signed by an S&TA, Instructor Examiner, or USPA Instructor.

3. Safety personnel should include properly trained and certified lifeguards.
   a. If suitably qualified skydivers are not available, assistance may normally be solicited from the local American Red Cross or other recognized training organization.
   b. Flotation gear and other lifesaving apparatus is recommended for non-swimmers.

4. Review all theoretical and practical training.

5. Initial training may be conducted in swimsuits, but final training is to be conducted in normal jump clothing to simulate a water landing.
   a. Non-swimmer: Training is to include basic skills covering breath control, bobbing, and front and back floating.
   b. Swimmer: Training is to include all of the above plus the breast stroke, side stroke, back stroke, and treading water.

6. While wearing a parachute harness and container system and all associated equipment, jump into the water.
   a. The USPA Instructor should then cast an open canopy over the jumper before any wave action subsides.
   b. Any type of canopy may be used
   c. The jumper should then perform the steps necessary to escape from the equipment and the water.
   d. Repeat this drill until proficient.
C. INTENTIONAL WATER LANDINGS

1. Any person intending to make an intentional water landing should:
   a. undergo preparatory training within 60 days of the water jump
      (1) The training should be conducted by an S&TA, Instructor Examiner, or USPA Instructor.
      (2) The training (including the date and location) should be documented in the jumper's logbook and signed by an S&TA, I/E or USPA Instructor.
   b. hold a USPA A license and have undergone wet training for water landings
   c. be a swimmer

2. Theoretical training should include classroom lessons covering:
   a. preparations necessary for safe operations
   b. equipment to be used
   c. procedures for the actual jump
   d. recovery of jumpers and equipment
   e. care of equipment

3. Preparation
   a. Obtain advice for the water jump from the local USPA S&TA or I/E.
   b. Check the landing site for underwater hazards.
   c. Use an altimeter for freefalls of 30 seconds or more.
   d. Provide no less than one recovery boat per jumper, or, if the aircraft drops one jumper per pass, one boat for every three jumpers.
   e. Boat personnel should include at least one qualified skydiver and stand-by swimmer with face mask, swim fins, and experience in lifesaving techniques, including resuscitation.
   f. Each jumper should be thoroughly briefed concerning the possible emergencies that may occur after water entry and the proper corrective procedures.
   g. opening altitude
      (1) Jumpers should open no less than 3,000 feet AGL to provide ample time to prepare for water entry.
      (2) This is especially true when the DZ is a small body of water and the jumper must concentrate on both accuracy and water entry.
   h. A second jump run should not be made until all jumpers from the first pass are safely aboard the pickup boat(s).

4. After canopy inflation: In calm conditions with readily accessible pick-up boats, the best procedure is simply to inflate the flotation gear and concentrate on landing in the proper area.

5. Landing
   a. In strong winds, choppy water conditions, in competitive water jump events, or if the flotation gear can not be inflated, separation from equipment after water entry is essential.
   b. Instruments:
      (1) Water may damage an altimeter.
      (2) Skydivers may want to remove instruments and place them in a waterproof bag.

D. WATER JUMP SAFETY CHECKS AND BRIEFINGS

1. A complete equipment check should be performed with particular attention to any additional equipment to be used or carried for the water jump (refer to SIM Section 5-4 on equipment checks).
2. Boat and ground crew briefings:
   a. communications procedures (smoke, radio, buoys, boats)
   b. wind limitations
   c. jump order
   d. control of spectators and other boats
   e. setting up the target
   f. maintenance of master log
   g. how to approach a jumper and canopy in the water (direction, proximity)
A. WHAT IS CANOPY RELATIVE WORK?

1. Canopy Formation is the name of the competition discipline for the skydiving activity commonly called canopy relative work (CRW) or “crew.”

2. Canopy formations are built by the intentional maneuvering of two or more open parachute canopies in close proximity to or in contact with one another during descent.

3. The most basic canopy formation is the hooking up of two canopies vertically in flight as a stack or plane, which is a compressed stack.

4. Canopy formations, both day and night, may be accomplished by experienced canopy formation specialists.

B. GENERAL

1. This section recommends procedures which experienced canopy formation enthusiasts have determined to be the safest methods of conducting aerial maneuvers under canopy.

2. Like group freefall, the concept of canopy relative work is that of smooth flow and grace between two or more jumpers and their canopies.

   a. Collisions that result in deflated canopies or entanglements and fast closing speeds are potentially very dangerous, not to mention aesthetically undesirable.

   b. Entanglements between two or more canopies in flight are the greatest danger in building canopy formations, because they can easily result in serious injury or death.

C. QUALIFICATIONS AND INITIAL TRAINING

1. Before engaging in canopy formations, a jumper should have:

   a. at least 20 jumps on a ram-air canopy

   b. thorough knowledge of canopy flight characteristics, to include riser maneuvers and an understanding of the relative compatibility of various canopies

   c. demonstrated accuracy capability of consistently landing within five meters of a target

2. For the first few jumps—

   a. Stacks might be simpler, but planes are more desirable.

   b. A plane is much more stable and has a reduced chance of resulting in canopy collapse.

3. Initial training should be conducted with two jumpers—the beginner and an instructor experienced in canopy formation—and include lessons in basic docking and break-off procedures, as well as emergency procedures.

D. EQUIPMENT

1. The following items are essential for safely building canopy formations:

   a. hook knife—necessary for resolving entanglements

   b. ankle protection

      (1) Adequate socks prevent abrasion from canopy lines.

      (2) If boots are used, cover any exposed metal hooks.

   c. pilot chute bridles

      (1) Short, single-attachment-point bridle cords are essential to reduce the danger of entanglement.

      (2) Retracting bridle pilot chute systems are desirable.

   d. cross connectors

      (1) A secure foothold at the top of the risers is essential for building planes.

      (2) Cross connectors should be attached between the front and rear risers only, not from side to side.

   e. open soft toggles that can be easily grasped

   f. trim tabs—helpful for equalizing descent rates and increasing control range

   g. cell crossporting (two rows)—recommended (per manufacturer’s specifications) to minimize the likelihood of canopy collapse.

   h. cascades—recommended to be removed from the two center A lines

E. RULES OF ENGAGEMENT

1. Weather considerations:

   a. Avoid jumping in turbulent air or gusty wind conditions.

   b. Early morning and early evening jumps are recommended in areas subject to thermal turbulence and other unstable air conditions.

   c. Avoid passing near clouds to avoid unpredictable air conditions.

   d. Use caution in flying formations over plowed fields, paved surfaces, or other areas where thermal conditions often exist.

   e. When encountering bumpy or unexpected turbulent air, it is recommended that all efforts be made to fly the formation directly into the wind.
2. Factors which must be considered in every pre-jump briefing include:
   a. exit order
   b. time between exits
   c. length of freefall
   d. designation of base-pin
   e. order of entry
   f. direction of flight and techniques of rendezvous
   g. approach and breakoff traffic patterns
   h. docking procedures
   i. formation flight procedures
   j. one-word verbal commands
   k. breakoff and landing procedures
   l. emergency procedures

3. Exit and opening procedures:
   a. Spotting procedures should be adjusted to include calculations for upper-wind velocity and direction.
   b. The aircraft pilot should be advised that a canopy formation group is exiting and opening high.
   c. Exits should be made at one- to three-second intervals.
   d. Freefall length should be adequate to assure clearance from the aircraft, jumper separation, and stable body position at opening.
   e. Upon opening, each jumper should be prepared to take immediate evasive action before maneuvering.

4. Docking procedures:
   a. base-pin
      (1) This position requires the most expertise of all; however, these skills are used in all slots.
      (2) It is recommended that two experienced canopy formation specialists perform this task.
   b. Formation flight course: It is important that the formation pilot maintain a constant direction of flight along a predetermined course.
   c. Traffic patterns: Establish an orderly flight pattern for canopies attempting to dock.
      (1) An orderly pattern will enable approaches to be made without interference and lessen the possibility of canopy collisions.
      (2) No canopies should ever pass in front of a formation; the wake turbulence created will disturb the formation's stability and could lead to a very dangerous situation.
   d. Approaches:
      (1) For smoothness and safety, each person entering the formation after base-pin should enter from behind and below.
      (2) Moderate angles of approach are recommended.
   e. Docking:
      (1) Only the center section of a docking canopy should be grasped when the canopy closes third or later in a stack formation.

(2) To complete the hookup, the feet can be placed behind and around the lines of the center cell.
(3) The line dock method is recommended.

f. Collapses:
   (1) Improper docks are the most common cause of collapsed canopies.
   (2) Collapsed canopies should be released to allow reinflation.
   (3) Experienced participants may be able to reinflate a collapsed canopy by continuing to plane down the lines.
   (4) The term "drop" should be used by a jumper wishing to be released from the formation.
      (i) This command is to be obeyed immediately.
      (ii) The jumper issuing the command should be sure to check behind for other canopies on approach before asking to be dropped.

5. Formation flight procedures:
   a. Verbal commands should be concise and direct.
   b. There should be no non-essential conversation.
   c. The pilot should fly the formation with limited control movements to minimize oscillations and facilitate docking.
   d. The formation pilot should never use deep brakes in the formation.
   e. Oscillations:
      (1) Oscillations are a primary concern in canopy formations, because they can result in collapsed canopies and entanglements
      (2) to reduce their effect and frequency, jumpers in the formation can—
         (i) Sit still in the harness and cross their legs when on the bottom of the formation.
         (ii) maintain an arch
         (iii) if on the bottom, add front riser trim to increase tension on the formation

6. Breakoff and landing procedures:
   a. Approaches and docking should stop no lower than 2,500 feet AGL.
   b. Formation pilots should avoid all obstacles, including those which produce thermal activity, such as paved surfaces, plowed fields, buildings, etc.
   c. The landing of canopy formations should be attempted by only those with a high level of CRW proficiency.
   d. Breakoff for landing should take place no lower than 2,500 feet AGL, because of the danger of entanglement at breakoff time.
   e. Jumpers should not attempt to land formations in high or gusty winds, high density altitudes, or high field elevations.
F. EMERGENCY PROCEDURES:

1. Entanglements are the greatest hazards when building canopy formations.
2. Jumpers should know their altitude at all times, because altitude will often dictate the course of action.
3. If a collision is imminent:
   a. The jumpers should spread one arm and both legs as wide as possible to reduce the possibility of penetrating the suspension lines.
   b. The other hand is used to protect the reserve ripcord.
4. Jumpers should be specific in discussing their intentions.
5. If altitude allows, emergency procedures should proceed only after acknowledgment by other jumper(s).
6. In the event of multiple cutaways and if altitude allows, jumpers should stagger reserve openings to avoid possible canopy collisions.
7. Respond to the given situation.
   a. When entanglements occur, jumpers must be prepared to react quickly and creatively.
   b. In many cases, the emergency is one that can’t be prepared for in advance; it may even be a problem no one imagined could happen.
8. If the entanglement occurs with sufficient altitude, the jumpers should attempt to clear the entanglement by following lines out before initiating emergency procedures.

G. NIGHT CANOPY FORMATIONS

HIGH ALTITUDE AND OXYGEN USE

A. PREPARATION AND PLANNING CRITICAL
   1. Skydives from altitudes higher than 15,000 feet above mean sea level (MSL) present the participants with a new range of important considerations.
   2. The reduced oxygen, lower atmospheric pressure and temperature, and the higher winds and airspeed above 15,000 feet MSL make skydiving more hazardous in this region than at lower altitudes.
   3. Hypoxia, which is oxygen deficiency, is the most immediate concern at higher altitudes.
      a. It can result in impaired judgement and even unconsciousness and death.
      b. Hypoxia can be prevented by the use of supplemental oxygen and procedures not required for skydives from lower altitudes.
   4. With proper training, adequate equipment, and well-planned procedures, high altitude skydives can be conducted within acceptable safety limits; without such precautions, they may result in disaster.

B. SCOPE
   1. These recommendations are presented to familiarize skydivers with:
      a. altitude classifications
      b. experience recommendations
      c. training recommendations
      d. equipment recommendations
      e. procedural recommendations
   2. General information is provided on the accompanying Planning Chart.

C. ALTITUDE CLASSIFICATIONS
   1. Low altitude: less than 15,000 feet MSL
   2. Intermediate altitude: from 15,000 feet up to 20,000 feet MSL
   3. High altitude: from 20,000 feet up to 40,000 feet MSL
   4. Extreme altitude: above 40,000 feet MSL

D. EXPERIENCE RECOMMENDED
   1. For intermediate-altitude jumps (15,000-20,000 feet MSL), participants should hold at least a USPA C license.
   2. For high-altitude jumps (20,000-40,000 feet MSL), participants should:
      a. hold a USPA D license
      b. have made at least one jump from 15,000 feet MSL or below using the same functioning bailout oxygen system
   3. For extreme-altitude jumps (40,000 feet MSL and higher), participants should:
      a. hold a USPA D license
      b. have made at least two jumps from below 35,000 feet MSL using the same functioning bailout oxygen and pressure systems

E. TRAINING RECOMMENDATIONS
   1. It is a benefit for participants on intermediate-altitude skydives to have completed physiological flight training (PFT) within the preceding 12 months.
   2. It is essential for all participants on high- and extreme-altitude skydives to have completed PFT within the preceding 12 months.
   3. PFT availability:
      a. The FAA’s Civil Aerospace Medical Institute offers a one-day aviation physiology course at any of 16 U.S. locations that have a hypobaric chamber that creates high altitude and rapid decompression scenarios.
      b. To attend training, applicants for PFT must hold at least a current FAA class 3 medical certificate.
   4. The PFT course:
      a. familiarizes the skydiver with the problems encountered in the high-altitude environment
      b. introduces basic high-altitude oxygen and pressure equipment and its use
      c. provides the opportunity to discover individual reactions to hypoxia and other altitude diseases through simulated high-altitude flights in a decompression chamber
   5. Applications:
      a. First, view the CAMI web site at www.cami.jccbi.gov/aam-400/asemphys.html and select the training site convenient to you.
      b. Then call 405-954-4837 to make application over the phone (when asked for aircraft type, state “skydiver;” when asked for company, state “USPA member.”)

F. RECOMMENDED EQUIPMENT
   1. General:
      a. A sensitive altimeter and adequate protective clothing are recommended for skydives from above 15,000 feet MSL in addition to the oxygen and body pressurization equipment listed below.
      b. In the event of a malfunction in the primary systems and components, backup oxygen systems and components should be available on board the aircraft.
      c. Moisture can cause oxygen mask valves to freeze.
         (1) Medical oxygen, which has a high moisture content, may be used when freezing temperatures will not be encountered.
         (2) Whenever freezing temperatures will be encountered, oxygen systems should be filled with only aviator’s oxygen, which has the moisture removed.
2. Intermediate-altitude jumps: A separate oxygen mask should be provided for each skydiver and aircrew member, although a common central oxygen bottle and regulator system may be used.

3. High-altitude jumps:
   a. All skydivers must be equipped with an appropriate on-board oxygen source and compatible bailout oxygen system, preferably with a backup bottle (see Planning Chart following this section).
   b. An automatic activation device (AAD) is recommended.

4. Extreme-altitude jumps:
   a. All skydivers must be equipped with compatible on-board and bailout oxygen and body pressurization systems appropriate to the goal altitude (see Planning Chart following this section).
   b. An AAD is recommended.

G. RECOMMENDED PREPARATIONS

1. General:
   a. All jumps must be coordinated in advance with the appropriate local, state, and federal aviation authorities.
   b. All jumps should be coordinated in advance with USPA for safety and for establishing new national and international skydiving records under the FAI Sporting Code.

2. Oxygen monitor:
   a. For group jumps from above 15,000 feet MSL, it is helpful to appoint an oxygen monitor whose duties are to:
      (1) be familiar with the operation of and to inspect, operate, and monitor the oxygen systems during their use
      (2) be watchful for symptoms of hypoxia and other altitude diseases in all jumpers
      (3) initiate appropriate remedial measures in the event of oxygen equipment malfunction or jumper illness
      (4) see that oxygen equipment is properly stowed before exit
   b. There should be one oxygen monitor for each six persons or each oxygen bottle, whichever is fewer.

3. Communications in the aircraft are extremely limited by the wearing of oxygen masks.
   a. The spotter and oxygen monitor should establish with the jumpers and aircrew a standard set of hand signals for the commands, inquiries, and responses required during flight.
   b. A small blackboard or similar device may be helpful for communicating lengthier messages.

   a. To prevent damage to aircraft and equipment and injury to persons from oxygen-fed flash fires, the aircraft should be electrically grounded during all ground practice.

b. No smoking should be permitted in the vicinity of the aircraft, either on the ground or aloft, while oxygen equipment is on board.

5. Ground practice
   a. Ground practice is essential due to—
      (1) restrictions on communication
      (2) the additional pre-exit activities required
      (3) restricted vision (by the mask)
      (4) restricted movement
         (i) results from bulkier clothing
         (ii) is often further irritated by long periods of sitting and low cabin temperatures during the climb to jump altitude
   b. Signals and exit procedures should be practiced on the ground in the actual jump aircraft until everyone can perform the procedures—
      (1) by hand-signal command
      (2) smoothly and without discussion
   c. Practice will prevent confusion aloft, which is inevitable without adequate rehearsal.

6. Equipment checks:
   a. Equipment should be checked prior to loading the aircraft and especially before exit.
   b. In addition, the oxygen monitor should perform the "P.D. McCripe" oxygen equipment inspection:
      P. pressure gauge
      D. diaphragm
      M. mask
      C. connections at mask
      C. connections at disconnect
      R. regulator
      I. indicator
      P. portable unit (walk-around bottle)
      E. emergency cylinders (bailout bottles)

H. OXYGEN USE PROCEDURES

Oxygen use procedures will vary with the equipment used, but the following are basic.

1. Intermediate altitude:
   a. All participants should put on masks and begin breathing oxygen at 8,000 feet MSL.
      (1) Breathing should be continuous throughout the remainder of the climb and jump run.
      (2) This procedure should be conducted under the supervision of the oxygen monitor.
      (3) This procedure is important (even if it doesn’t seem necessary), especially if more than one jump per day is planned.
   b. Two minutes from exit—
      (1) The spotter signals “get ready.”
      (2) At this time, all jumpers move into the ready position and prepare to remove their oxygen masks.
I. Spotting Procedures

1. Direction of the wind at altitude and on the surface may not coincide.
   a. Winds aloft may also be stronger than surface winds (the jet stream is found at high altitude).
   b. Adjust the exit point for freefall drift to allow for winds aloft.
   c. Exit point and opening point will not coincide.
2. The higher ground speeds attained by an aircraft indicating the same airspeed as usual at lower altitude radically increases the distance of forward throw that will be encountered on exit.
3. To calculate the exit point, consult FAA Flight Service for the winds aloft up to the planned exit altitude.
   a. Using an average freefall rate of 10,000 feet per minute, compute the time required to freefall through each different layer of wind direction and speed reported.
   b. Insert the time and wind speed figure into the following equation and solve for wind drift through each layer:

\[
\text{Drift} = \text{Wind Velocity} \times \text{Time of Exposure}
\]

(1) The time component of wind speed and time of exposure must both be expressed in or converted to the same units, (i.e., feet per second and seconds, miles per hour and hours).

(2) The drift distance will then be expressed in the same unit as the distance unit of the wind speed figure.
4. Use a sheet of acetate, a grease pencil, and a map or aerial photo of the DZ and surrounding area to plot the exit point.
   a. On the acetate, mark a north-south reference line.
   b. Then beginning with the topmost wind layer and proceeding to the lowest layer:
      (1) In the same scale as the map or photo, plot the computed wind drift for each by a line.
      (2) Join the beginning of the line representing the drift anticipated in the next lower layer to the end of the line from the one above.
   c. The resulting zigzag line represents the total wind drift expected during freefall, without tracking.
   d. In the opposite direction of the exit altitude wind drift (or in the direction of the jump run, if it is not to coincide with the wind direction) add 2,000 feet to compensate for forward throw from the aircraft.
5. Throw wind-drift indicators at the planned opening altitude to determine the opening point, then, orient the acetate over the photo or map.
   a. Place the end of the freefall wind drift line on the opening point indicated by the wind drift indicators.
   b. The other end of the wind drift line now indicates the exit point.
4. Jump run should be oriented directly into the wind at exit altitude to prevent lateral drift if spotting is to be primarily visual.

5. Navigational aids may be used as the primary spotting reference, but the spot should always be confirmed visually prior to exit.

J. HAZARDS OF OPENINGS AT HIGHER ALTITUDES

1. As terminal velocity increases, so does the rate of change in speed from freefall to open canopy.
   a. At normal opening altitude, terminal velocity is about 160 feet per second (fps) and the rate of descent under open canopy is about 15 fps; thus, the change in velocity at opening is about 145 fps.
   b. By comparison, the figures for an opening at 40,000 feet MSL are 336 minus 40, or a 296 fps change in velocity in the same period of time.
   c. At 60,000 feet MSL the change in velocity is even more striking: 543 minus 64, or 479 fps.

2. Because of the higher terminal velocity at the higher altitudes—
   a. It is clear that an inadvertent opening can cause serious injury as result of the greater opening shock experienced.
   b. In addition, the equipment may not be able to withstand the load without damage.

3. Even if a skydiver were not injured and the equipment not damaged, he or she would still face an extended period of exposure to the extreme cold at altitude.

4. Another hazard of a canopy opening at higher altitude is hypoxia.

*MSL: Mean Sea Level*
### Average Freefall (in Seconds) for 2,000 Feet AGL Opening

<table>
<thead>
<tr>
<th>Aircraft Required</th>
<th>Hypoxia Symptoms</th>
<th>Special Considerations</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gas Balloon</td>
<td>Loss of Consciousness, convulsions, loss of consciousness.*</td>
<td>In this region, supersonic speeds may be attained during the freefall. The effects of trans-sonic and supersonic freefall on sky divers and their equipment are not known at this time.</td>
</tr>
<tr>
<td>Turbo Jet</td>
<td>Loss of muscular control, judgment, memory, reasoning, time-sense, repeated purposeless movements, emotional outbursts.</td>
<td>At 63,000 feet MSL, the critical pressure of your blood and body fluids is reached. Without pressurization, or in the event of a failure of pressurization at or above this altitude, your blood and body fluids will boil.</td>
</tr>
<tr>
<td>Turbocharged engine</td>
<td>Loss of Consciousness. Convulsions, loss of consciousness.*</td>
<td>In the event of an inadvertent parachute deployment at high or extreme altitude, the parachutist (if conscious) should break away from that parachute and freefall to a lower altitude, if there is insufficient oxygen for a canopy descent to 15,000 feet MSL.</td>
</tr>
<tr>
<td>Reciprocating engine</td>
<td>False sense of well-being, overconfidence, faulty reasoning, narrowing field of attention, blurring vision, poor memory, fatigue drowsiness, headache, poor judgment.</td>
<td>The opening shock and malfunction probability of a deploying parachute increases radically with altitude. A final equipment check before leaving the aircraft will help prevent premature deployment.</td>
</tr>
</tbody>
</table>

*AADs are recommended as a backup system on all high-altitude jumps, due to the possibility of the skydiver being rendered unconscious by oxygen system failure. **Always rehearse oxygen, communication, and exit procedures before takeoff. ***Minimum equipment listed. Equipment shown for higher altitudes satisfies all requirements for lower altitudes. ****Oxygen systems for high-altitude flights and skydiving should be filled with aviator's oxygen, not medical oxygen. Medical oxygen has a high moisture content which can cause oxygen mask valves to ice over in high-altitude operations.
A. INTRODUCTION
1. Skydiving provides a wealth of visual stimulation that can be readily captured through still and video photography.
2. Advancing imaging technology has made it easier and less expensive to take cameras on a jump.
3. Jumpers need to exercise caution with respect to camera flying:
   a. camera equipment and its interaction with the parachute system
   b. activities on the jump
   c. breakoff procedures
   d. special emergency procedures for camera flyers
4. Once a camera flyer has become completely familiar with the equipment and procedures of the discipline, he or she will be able to experiment and perform creatively.

B. BACKGROUND
1. In the early days:
   a. Early pioneer camera flyers had to solve the obvious problems presented by big, cumbersome camera equipment and parachutes.
   b. Only the most experienced jumpers and photographers would brave the activity of filming others.
2. More recently:
   a. Miniature digital still and video cameras appear to present less of a challenge, encouraging more jumpers to use cameras on their jumps.
   b. Skydivers have become less concerned about the skill of a camera flyer jumping with their group.

C. PURPOSE
1. Recommendations for flying cameras should educate potential camera flyers and those making jumps with them.
2. Jumpers should realize that flying a camera is a serious decision, and that it requires additional effort and attention on each jump.

D. EQUIPMENT
1. A camera flyer should consult another experienced camera flyer and a rigger before using any new or modified piece of equipment on a camera jump:
   a. helmet
   b. parachute
   c. deployment device modification
   d. camera
   e. camera mount
   f. flash
   g. switch and mounting
   h. camera suit
   i. other
      (1) sky surfboard or skis
      (2) tubes or other freefall toys
      (3) wingsuit
2. Prior to filming other skydivers, each new or additional piece of equipment should be jumped until the camera flyer is completely familiar with it and has adjusted any procedures accordingly.
3. Camera equipment
   a. Small cameras are not necessarily safer to jump than larger ones.
   b. Regardless of location, any camera mount should be placed and rigged with respect to the deploying parachutes.
   c. All edges and potential snag areas should be covered, taped, or otherwise protected.
      (1) Necessary snag points on helmet-mounted cameras should at least face away from the deploying parachute.
      (3) A pyramid shape of the entire camera mounting system may deflect lines better than an egg shape.
      (4) Deflectors can help protect areas that can't be otherwise modified to reduce problems.
      (5) All gaps between the helmet and equipment, including mounting plates, should be taped or filled (hot glue, etc.).
      (5) Protrusions, such as camera sites, should be engineered to present the least potential for snags.
      (6) Ground testing should include dragging a suspension line over the camera assembly to reveal snag points.
   d. Sharp edges and protrusions can injure other jumpers in the event of a collision or emergency aircraft landing.
   e. Cameras mounted on a jumper’s extremities need to be kept clear during deployment.
   f. Camera operation devices (switches, cables) need to be simple and secure.
   g. Each added piece of equipment needs to be analyzed for its potential interaction with the overall camera system and the parachute.
4. Helms and camera mounts
   a. All camera platforms, whether custom or off the shelf, should be evaluated for safety and suitability to the camera flyer’s purpose.
      (1) by a rigger
      (2) by an experienced camera flyer
b. The helmet should provide full visibility for the camera flyer:
   (1) in freefall
   (2) under canopy
   (3) during emergency procedures
c. Empty camera mounts should be covered and taped to prevent snags.

5. Helmet releases
   a. An emergency release is recommended for camera helmets in the event of an equipment entanglement.
   b. Emergency helmet releases should be easy to operate with either hand.
c. Using a reliable helmet closure or clasp that can also be used as an emergency release promotes familiarity with the system.

6. Parachute
   a. Camera flyers should use a reliable parachute that opens slowly and on heading.
   b. The deployment system needs to be compatible with the camera suit, if used.
c. Camera suit wings and lower connections must not interfere with the camera flyer's parachute operation handles or main bridle routing in any freefall orientation.
   d. The pilot chute and bridle length must be sufficient to overcome the additional burble created by a camera suit, if worn.
   e. If the camera flyer generally opens higher than the other jumpers, a slower descending canopy will help reduce traffic conflicts.
   f. The camera flyer should weigh the advantages against the disadvantages of a reserve static line in the event of a partial malfunction.
   (1) Advantages: could assist after a low cutaway or when disoriented during cutaway procedures
   (2) Disadvantages: could deploy the reserve during instability following a cutaway, increasing the chances for the reserve entangling with the camera system, especially a poorly designed one
g. As always, proper attention to packing and maintenance, especially line stowage, helps prevent hard openings and malfunctions.

7. Recommended accessory equipment
   a. audible altimeter
   b. visual altimeter that can be seen while photographing
   c. hook knife

E. PROCEDURES

1. General
   a. Prior to jumping, a skydiver should have enough general jump experience to be able to handle any skydiving emergency or minor problem easily and without stress.

b. A camera flyer should possess freefall flying skills well above average and applicable to the planned jump.
   (1) belly-to-earth
   (2) freeflying (upright and head-down)
   (3) canopy formation
   (4) multiple (for skysurfing, filming student training jumps, etc.)
c. A USPA D license is recommended.
d. The jumper should have made at least 50 recent jumps on the same parachute equipment to be used for camera flying.
e. The camera flyer should know the experience and skills of all the jumpers in the group.
f. Deployment:
   (1) The deployment altitude should allow time to deal with the additional equipment and its associated problems.
   (2) The camera flyer must remain aware of other jumpers during deployment.
g. Each camera flyer should conduct a complete camera and parachute equipment check before rigging up, before boarding the plane, and again prior to exit.
h. Camera jumps should be approached procedurally, with the same routine followed on every jump.
i. The priorities on the jump should be the parachute equipment and procedures first, then the camera equipment and procedures.
j. Introduce only one new variable (procedure or equipment) at a time.
k. A camera jump requires additional planning and should never be considered just another skydive.

2. Aircraft
   a. Cameras should be worn or secured during take off and landing to prevent them from becoming a projectile in the event of sudden movement.
   b. A camera flyer needs to be aware of the additional space the camera requires:
      (1) Use caution when the door is opening to prevent getting hit by door components.
      (2) Practice climbout procedures in each aircraft to prevent injury resulting from catching the camera on the door or other part of the aircraft.
      (3) To prevent injury and damage to the aircraft, the camera flyer should coordinate with the pilot before attempting any new climbout position.

3. Exit
   a. Unless the plan calls for the camera flyer to be part of the exit, he or she should remain clear of the group, being mindful of the airspace opposite the exiting jumpers' relative wind.
   b. A collision can be more serious with a jumper wearing a camera helmet.
c. Student jumpers can become disoriented if encountering a camera flyer unexpectedly.
d. A tandem parachutist in command requires clear airspace to deploy a drogue.
e. Skydivers occasionally experience inadvertent openings on exit.

4. Freefall
a. The jumpers should prepare a freefall plan with the camera flyer, to include:
   (1) the camera flyer's position in relation to the group
   (2) any planned camera flyer interaction with the group
b. The jumpers and the camera flyer should follow the plan.

c. Student jumpers can become disoriented if encountering a camera flyer unexpectedly.
d. A tandem parachutist in command requires clear airspace to deploy a drogue.
e. Skydivers occasionally experience inadvertent openings on exit.

5. Exit and breakoff
a. All jumpers on the load should understand the camera flyer's breakoff and deployment plan.
b. Two or more camera flyers must coordinate the breakoff and deployment more carefully than when only one camera flyer is involved.
c. Filming other jumpers through deployment should be planned in consideration of the opening altitudes of all the jumpers involved and with their cooperation.
d. The camera flyer should maintain awareness of his or her position over the ground and deploy high enough to reach a safe landing area.

6. Deployment
a. The camera flyer must exercise added caution during deployment:
   (1) to prevent malfunctions
   (2) to assure an on-heading deployment and reduce the likelihood of line twist
   (3) to avoid neck injury
b. New camera flyers should consult with experienced camera flyers for specific techniques to prevent accidents during deployment and inflation.
c. Malfunction, serious injury, or death could occur if the lines of a deploying parachute become snagged on camera equipment.

7. Parachute emergencies
a. The additional equipment worn for filming can complicate emergency procedures.
b. Each camera flyer should regularly practice all parachute emergency procedures under canopy or in a training harness while fully rigged for a camera jump.
c. Emergency procedure practice should include removing the helmet with either hand in response to certain malfunctions.
d. Routine emergency procedures should be practiced during every jump.
e. When to release the helmet:
   (1) equipment entanglements
   (2) obstacle landings (water, trees, building, power lines)
   (3) whenever a dangerous situation presents itself

F. CONSIDERATIONS FOR FILMING STUDENTS
1. Refer to the USPA Instructional Rating Manual for guidelines on minimum experience and qualifications for flying camera for student training jumps.
a. A skydiver should have extensive camera flying experience with experienced jumpers prior to photographing or videoing student jumps.
b. The USPA Instructor supervising the jump should conduct a thorough briefing with the camera flyer prior to boarding.
c. All procedures and the camera plan should be shared among the USPA Coach or Instructor, the camera flyer, and the student making the jump.

2. The instructors' full attention is supposed to be on the student, and the student is incapable of considering the movements and needs of the camera flyer.

3. The camera flyer should avoid the area directly above or below a student or instructor(s).
a. Students may deploy without warning.
b. Disturbing the student's or instructors' air could compromise their performance and the safety of the jumpers.

4. Exit
a. The camera flyer should plan an exit position that avoids contact with the student or the instructor(s).
b. During the exit, students often give erratic exit counts, making exit timing difficult for the camera flyer.
   (1) The camera flyer may leave slightly before the student exits if the count is reliable.
   (2) The camera flyer should follow slightly after the student's exit whenever the student's exit timing is uncertain.
c. When filming tandem jumpers, the camera flyer must remain clear of the deploying drogue

5. The camera flyer needs to maintain independent altitude awareness and never rely on the student or instructor(s).

6. Opening
a. The camera flyer is responsible for opening separation from the student and the instructor(s).
b. While dramatic, aggressive filming of openings compromises the safety of the student, the instructor(s), and the camera flyer.

7. When using larger aircraft, student groups typically exit farther upwind, which may require a higher opening for the camera flyer to safely return to the landing area.
WING SUIT RECOMMENDATIONS

A. PURPOSE

1. Wing suits are specially designed jumpsuits with fabric membranes located between the legs of the jumper and from each arm to the torso.
   a. The membranes typically are inflatable, dual-surface designs to produce lift.
   b. Wing suits slow the jumpers descent in freefall and increase glide.
2. Using a wing suit, jumpers can stay aloft longer and cover longer horizontal distances in freefall relative to other jumpers.

B. BACKGROUND

1. The original wing extension designs, called “batwings” were introduced in the 1950s.
   a. Due to a number of fatalities attributed to control and equipment problems, USPA rules prohibited them.
   b. In 1987, the USPA Board removed the batwing rule from the USPA Basic Safety Requirements, since jumpers had long since stopped using the devices and since camera flyers were using a variation to improve maneuverability in head-high attitudes.
2. By the late 1990s, modern equipment and better designs made wing suits popular once again.
3. In 2002, these recommendations were adopted in cooperation with wing-suit promoters and training facilities.

C. QUALIFICATIONS AND PREPARATION

1. Before attempting a wing-suit jump, a skydiver should:
   a. have a minimum of 500 freefall skydives; or a minimum of 200 freefall skydives, made within the past 18 months, and receive one-on-one instruction from an experienced wing suit jumper
   b. completely read and understand all documentation and training information provided with the wing suit
   c. have the ability to perform exits and skydive in the deployment position described in this outline before making a jump with the wing suit
2. Training by an experienced wing-suit flyer should cover the following topics:
   a. gear selection, especially canopy choice and the deployment device
   b. rigging and wearing the wing suit
   c. aircraft pilot briefing and skydiver heading awareness during wing-suit flights
   d. aircraft exit techniques
   e. basic flight techniques for wing-suit flights
   f. deployment procedures
   g. emergency procedures

D. EQUIPMENT

1. The correct parachute deployment device and method are critical for successful wing-suit jumps.
   a. Arm motion is very limited for the main deployment procedure.
   b. The suit generates a large burble behind the jumper.
   c. Bottom-of-container throw-out pilot chute is the only deployment system that should be used while making a wing-suit jump.
   d. Under no circumstances should a pull-out system, leg-mounted throw-out, or ripcord-activated, spring-loaded pilot chute be used.
2. Wing suits must be worn correctly to ensure proper performance during the flight and that safe deployment and emergency procedures can be carried out by the jumper who is wearing the suit.
   a. Arm-torso fabric membranes should include a quick-release system that the jumper can operate in any flight mode.
   b. Leg-leg membranes should also be releaseable to allow the jumper free leg movement during landing.
   c. After the suit is on, the jumper should make sure that all of the straps and operation handles can be accessed properly.
3. Canopy choice is an important consideration for wing-suit jumps.
   a. The main canopy should be docile in nature with consistent opening characteristics.
   b. Problems such as abrupt heading changes or line twists on opening can become a much larger problem due to the jumper’s limited extremity movement when wearing a wing suit.
   c. The jumper should use a familiar canopy.

E. EXIT TECHNIQUES

1. Flight plan:
   a. To avoid entering the airspace of other groups of jumpers, wing-suit jumpers should plan to fly the wing suit off the line of flight for jump run.
   b. The wing-suit jumper(s) should coordinate with the pilot for the planned jump run and make the aircraft pilot aware of the wing-suit jump flight plan.
   c. Because of the slow descent and horizontal capabilities of a wing suit, the pilot and wingsuit jumper should fly away from each other following exit.
2. There are many possible variations of exits and aircraft configurations, but wing-suit jumpers should exit the aircraft first or last.
F. DEPLOYMENT

1. Deployment is generally considered the most complicated part of flying a wing suit.
2. Deployment procedures should be practiced on the ground until smooth and proficient.
3. Stop all radical maneuvers by 6,000 feet AGL.
4. The wave-off signal is accomplished by clicking the heels together several times.
5. Recommended deployment altitude:
   a. Beginning wing-suit jumpers should initiate deployment no lower than 5,000 feet.
   b. Once a jumper has become comfortable with the equipment and procedures, deployment is recommended by 3,000 feet.
6. Keeping the body symmetrical is critical for safe deployment.
   a. Start by closing the legs and bringing both arms to the side of the body.
   b. Keep the legs slightly extended to create a slightly head-down attitude and improve air flow over the back of the jumper.
7. Initiating deployment
   a. Bring both hands in symmetrically while grasping the pilot chute handle with the hand on that side.
   b. With the wrist of the pilot-chute hand, quickly flick the pilot chute into the airstream to the side of the jumper while bringing both arms to full wing extension symmetrically.
   c. Quickly retract both arms to re-collapse the wings as soon as the pilot chute is released.
8. As soon as possible after deployment:
   a. Release the wing extensions (typically a zipper is provided for non-emergency situations).
   b. Begin controlling the canopy using the back risers to maintain heading and fly clear of traffic.
9. After establishing a controllable canopy and a clear heading, release the membrane between the legs.
10. Once the wing suit is ready for the remainder of descent and landing, release the brakes for full canopy flight.

G. EMERGENCY PROCEDURES

1. If one wing comes loose in freefall the other should be released immediately.
2. Routine parachute emergency procedures should be planned and carried out with the wings of the suit still attached.
3. If the main canopy malfunctions and requires a cutaway, the legs should be closed together to collapse the wing.
4. Unless it becomes necessary, do not waste time releasing the wings in the event of an equipment emergency.

H. INITIAL WING-SUIT FLIGHTS

1. Practice the deployment position soon after exit on the first jump.
2. Learn basic stable flight with the wing suit before trying radical turns or barrel rolls.
3. Learn to control fall rate and heading with solo jumps before jumping with other wing-suit skydivers.

I. DEPLOYMENT ALTITUDE

1. Despite the lower rate of descent of a wing suit, the same USPA BSR minimum deployment altitudes apply to wing suit skydives as to any other type of skydive.
2. Attempting to land using a wing suit without deploying the parachute would likely result in serious injury or death.
EXHIBITION JUMPING AND RATING

Section Summary:

A demonstration jump, also called a display or exhibition jump, is a jump at a location other than an existing drop zone done for the purpose of reward, remuneration, or promotion and principally for the benefit of spectators. One purpose of USPA is to promote successful demonstration jumps as part of an overall public relations program for the sport.

These recommendations cover the following: experience, ability and attitude, the Professional Exhibition (PRO) Rating, landing area size, technical considerations, insurance, and how to complete the FAA authorization request form.

Important Reference Numbers

- USPA and FAA definitions of landing areas—Table 7.A
- exhibition jump approval requirements—7-1.N
- PRO Rating requirements for application, renewal, and requalification—7-2
- FAA’s instructions for completing Form 7711-2 requesting approval to jump into congested areas—7-3

Who needs this section?

- jumpers preparing for the USPA PRO Rating
- jumpers planning exhibition jumps
- USPA officials advising jumpers on exhibition jumps
EXHIBITION JUMPING

A. DEFINITION

An exhibition jump, also called a demonstration or display jump, is a jump at a location other than an existing drop zone done for the purpose of reward, remuneration, or promotion and principally for the benefit of spectators.

B. HOW TO APPROACH A DEMO JUMP

1. As with all jumps, safety must be the first consideration.
2. Next, the most important aspect of a demonstration jump is landing in the target area.
   a. Good aerial work is not impressive if the jumpers land out.
   b. A stand-up landing in the target area is usually the most visible and impressive portion of a demonstration jump.
3. Demo jumps have many variables which must be considered, including wind speed and direction, equipment type, jumper experience, target areas, and alternate landing areas.
4. Each proposed demo needs to be evaluated on an individual basis.

Table 7.A–Size and Definition of Landing Areas

<table>
<thead>
<tr>
<th>OPEN FIELD</th>
<th>LEVEL 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. A minimum-sized area that will accommodate a landing area no less than 500,000 square feet (e.g., 750 x 750 feet, or an area with the sum total that equals 500,000 square feet)</td>
<td>1. An area that will not accommodate a 250,000 square-foot landing area (500 x 500-foot area) but will allow an area no smaller than 5,000 square feet per four jumpers</td>
</tr>
<tr>
<td>2. Allows a jumper to drift over the spectators with sufficient altitude (250 feet) so as not to create a hazard to persons or property on the ground</td>
<td>2. Allows jumpers to fly under canopy no lower than 50 feet above the crowd and land no closer than 15 feet from the crowd line</td>
</tr>
<tr>
<td>3. Will accommodate landing no closer than 100 feet from the spectators</td>
<td>3. Parachutists who certify that they will use both ram-air main and ram-air reserve parachutes will be permitted to exit over or into a congested area but not exit over an open-air assembly of people.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>LEVEL 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. An area that will accommodate a landing area no smaller than at least 250,000 square feet up to 500,000 square feet (example: 500 x 500 feet, up to 750 x 750 feet)</td>
</tr>
<tr>
<td>2. Or an area with the sum total that equals 250,000 square feet, up to 500,000 square feet) with a one-sided linear crowd line</td>
</tr>
<tr>
<td>3. Allows jumpers to drift over the spectators with sufficient altitude (250 feet) so as not to create a hazard to persons or property on the ground</td>
</tr>
<tr>
<td>4. Will accommodate landing no closer than 50 feet from the spectators</td>
</tr>
<tr>
<td>5. Many Open-Field athletic areas constitute a Level 1 area.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>STADIUM</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. A Level 2 landing area smaller than 150 yards in length by 80 yards in width and bounded on two or more sides by bleachers, walls, or buildings in excess of 50 feet high</td>
</tr>
<tr>
<td>2. This area would also require an FAA Form 7711-2 to conduct an approved demonstration jump.</td>
</tr>
</tbody>
</table>

C. EXPERIENCE AND ABILITY

1. Open Field and Level 1, as defined by USPA and accepted by the FAA (all of the following):
   a. USPA D license or higher recommended
   b. 50 jumps on the same canopy within the past 12 months
   c. five jumps within the previous 60 days
2. Level 2 and Stadium, as defined by USPA and accepted by the FAA (all of the following):
   a. hold the USPA PRO rating (required by the BSRs)
   b. 50 jumps on the same canopy within the past 12 months
   c. five jumps within the previous 60 days

D. ATTITUDE

1. While a good demonstration jump provides great public relations for the sport, a poorly performed one may severely damage skydiving’s image.
a. Therefore, it is important to recognize and understand that sometimes it may be in the best interest of the individual jumper and skydiving in general not to make the jump at all.

b. A mature attitude should be exhibited at all times.

2. Promise no more than you can produce and then perform with expertise and efficiency.

3. Take no unnecessary chances.

4. Know what you are getting into before getting there.

5. Recognize and deal with the air of excitement that surrounds a demo jump.

6. Make mature and professional judgments in dealing with unforeseen circumstances.

7. Delay or cancel the demo when conditions are not right for a safe jump.

8. Jumpers and support staff should have a sharp, clean appearance to make a better impression and present a professional image.

E. LANDING AREAS

1. All FAA-authorized demonstration jumps are classified as either Open Field, level 1, Level 2, or Stadium.

2. USPA with the FAA’s concurrence defines these areas as described in Table 7.A, Size and Definition of Landing Areas (inset on previous page).

4. Minimum landing areas for PRO Rating holders:
   a. For PRO Rating holders, there should be no less than 5,000 square feet of landing area per four jumpers.
   b. An additional 800 square feet per jumper is required for any jumper landing within 30 seconds of the last of any four jumpers.

3. Alternate landing areas (run-offs or escape areas) must be considered when evaluating a demonstration jump.
   a. Small targets often become acceptable when alternates are available.
   b. The alternate landing area must be of sufficient size to accommodate, as a minimum, a Level 1 landing area for the jumper(s) and as not to create a hazard to persons or property on the ground.

F. TURBULENCE AND TARGET PLACEMENT

1. Recommended minimum distances from major obstacles should never be disregarded, especially in windy conditions.
   a. Major obstacles affect air currents and can cause turbulence.
   b. Major obstacles include large buildings and trees.
   c. A single tree, pole, fence, etc., is not considered as a major obstacle.
   d. Stadium jumps usually involve turbulence that should be considered.

2. Jumpers should be thoroughly familiar with the turbulent-air flight characteristics of their canopies.

G. MAXIMUM WINDS

1. When considering wind limits, include wind turbulence and the capabilities of the reserve canopy.

2. USPA recommends that all demonstration jumps be conducted with a maximum 15-mpg ground wind limitation.

3. For stadium jumps, the wind should be measured at the top of the stadium and turbulence should always be anticipated.

H. EQUIPMENT

1. Main canopy:
   a. Open Field, Level 1, and Stadium: ram-air type recommended by USPA
   b. Level 2: ram-air required by FAA

2. Reserve canopy:
   a. Open Field: should be steerable
   b. Level 1, Level 2, and Stadium: ram-air reserve required by FAA

3. Smoke should be hand-carried or attached to an easily ejectable boot bracket.

Warning: military type (M-18) smoke grenades are extremely hot and should not be hand held.

I. AERIAL MANEUVERS

1. Aerial maneuvers should be rehearsed, just as any professional would give a show a dry run.
   a. Participants should be aware of their exit point, freefall drift, and opening point.
   b. Landing on target takes priority over air work.
   c. One should be prepared to break off, track, or pull high if necessary.

2. Some suggested freefall maneuvers:
   a. barber pole:
      (1) Two or more jumpers with two or more colors of smoke exit and hook up.
      (2) The jumpers then spin the formation creating a giant barber pole.
   b. starburst: Three or more jumpers exit and form a star, then break, make a 180° turn, and track apart.
   c. cutaway:
      (1) One jumper opens, cuts away, and deploys a second main canopy.
      (2) The jumper is required to wear three parachutes, one of which must be a TSO’ed reserve, and the reserve must be attached to a TSO’ed harness.
3. Some suggested canopy maneuvers:
   a. smoke
      (1) After opening, ignite smoke and drop on a ten-foot line.
      (2) Make a series of turns in one direction.
      (3) The line should be releaseable from the upper end if it becomes necessary.
      (4) Be careful in crossing over obstacles on approach.
      (5) Make sure the smoke container won’t burn through the line.
   b. flag
      (1) A flag may be attached to the rear lines or dropped below the jumper on a weighted line.
      (2) A ground crew should catch the flag so that it won’t touch the ground.
   c. canopy formation
      (1) Canopy maneuvers should be performed by only experienced CRW jumpers.
      (2) Efforts to build canopy formations should stop no lower than 2,500 feet AGL.
      (3) It is much more difficult and dangerous to land a canopy stack on target than it is to land canopies separately.
   d. Radical canopy maneuvers should not be performed below 500 feet, where the jumper has only about 30 seconds to set up for landing.

J. CROWD CONTROL
1. Collisions with spectators present a great danger to the spectator, the jumper, and the well-being of the sport.
   a. Reasonable precautions should be taken to keep the spectators out of the landing area.
   b. People not sitting may move toward the target, but they will not always move out of the way of the landing jumper.
2. Jumpers should pick up their equipment immediately after landing.
   a. Some spectators may decide that skydiving equipment makes good souvenirs.
   b. Jumpers who plan on packing in the crowd should protect against equipment damage by spectators’ drinks and cigarettes.

K. GROUND SIGNALS
1. Ground-to-air communication must be maintained (BSRs).
   a. This may be accomplished by a radio, smoke, or a panel.
   b. It is best if a backup to the primary signal exists in case the primary signal fails.
2. If a Certificate of Authorization (FAA Form 7711-1) is issued, it may require ground-to-air radio communication.

L. ANNOUNCER
1. An experienced skydiver on the public address system contributes to a quality demonstration jump.
2. The announcer can point out the aircraft, explain each phase of the jump, give general information, and explain any unusual occurrences, such as a reserve activation or a jumper missing the target.
3. The announcer can contribute to crowd control by asking spectators not to enter the target area.

M. OTHER ACTIVITIES
1. Activities after the jump add to the entertainment of the spectators.
2. Packing demonstration:
   a. Team members pack their parachutes in view of the spectators.
   b. Jumpers should pack slowly, explaining each step and answering questions.
   c. Often, this facet of the demonstration is more effective if one person packs while another does the talking.
3. Answering questions:
   a. Respond to spectator questions politely and factually.
   b. Direct persons interested in jumping to USPA or distribute brochures advertising a drop zone.

N. ADVICE AND APPROVAL
1. Approval may need to be secured from federal, state, or local officials before a demonstration jump can be performed.
2. Local approval
   a. It may be necessary to contact local authorities prior to a jump.
   b. The FARs require airport management approval prior to a jump onto the airport (FAR 105.23.2.b).
   c. A call to the local police is recommended.
      (1) They may offer to help in crowd control.
      (2) With prior knowledge of the jump, they are less likely to respond to a call, such as, “There has been a mishap, and people are falling out of the sky.”
3. State approval
   a. It may be necessary to contact the state department of aviation.
   b. The local S&TA or Instructor Examiner notified of the demonstration jump should be able to assist the organizers in meeting all state requirements.
4. **FAA approval:** Almost every jump requires either that the FAA be notified or an air traffic control authorization be received (FAR 105.25).
   a. For any jump, the traffic control facility having jurisdiction over the airspace at the first intended exit altitude must be notified at least one hour before the jump.
   b. Congested areas and open air assembly of persons:
      (1) FAR 105.21.a. states that no jump be made over or into a congested area or an open air assembly of persons until a certificate of authorization has been issued (FAA Form 7711-1).
      (2) Application for authorization may be filed with the local Flight Standards District Office.
      (3) The FAA's instructions on how to fill out the application, FAA Form 7711-2, are included in SIM Section 7-3.
      (3) The local S&TA or Instructor Examiner notified of the demo should be able to assist the organizers in meeting all federal requirements.
5. **Notification and advice:**
   a. The jumper is required by the BSRs to contact the local S&TA or an Instructor Examiner for demonstration jump advice.
   b. The information should be provided as outlined in FAR 105.15.a.
   c. The S&TA or an I/E providing advice for a demonstration jump should use this section as a guideline.
   d. The I/E whose advice was sought should contact the S&TA for the area or the drop zone at which the flight will originate.
   e. The S&TA should assist the jumpers in meeting all applicable state and federal requirements and check that the requirements have been met.
   f. All authorizations and permits should be carried on the jump by the organizer or team captain.
   g. The S&TA should investigate both the proposed area and the participants.
      (1) The S&TA or I/E may recommend the use of specific jumpers or advise the organizer to use only individuals meeting certain experience requirements.
      (2) General advice allows the organizer greater flexibility in making last-minute substitutions of aircraft and participants.
   h. When consulted for a demonstration jump, the S&TA may recommend certain additional limitations such as wind speed and direction, altitude, etc.
   i. The S&TA should consider the information in this section when making recommendations and should ask the question, “All things considered, are the chances of performing a safe and professional demonstration jump reasonably good?”

### O. INSURANCE
1. USPA individual membership liability skydiving insurance (property damage and bodily injury), which is included as a benefit of USPA membership, is not valid for demonstration jumps.
2. Demonstration jump insurance can be obtained through USPA in accordance with the Demonstration Jump Insurance Program; contact USPA for information.

### P. RELATED READINGS
1. FAA Part 105, Parachute Operations
2. FAA AC 105-2, Sport Parachute Jumping
3. FAA AC 91-45, Waivers: Aviation Events
A. WHAT IS A PRO RATING?

1. Working in conjunction with the FAA, the USPA issues Professional Exhibition (PRO) Ratings to any USPA member who has met the current requirements for the rating.
   a. This rating identifies the jumper as highly proficient and accurate in canopy control.
   b. A PRO Rating holder is also knowledgeable in the areas of coordination with the Federal Aviation Administration, obtaining insurance coverage, and providing a professional demonstration of skills.

2. A USPA PRO Rating is not required for all demonstration jumps, but may be a valuable advantage in working with the FAA.

3. The PRO Rating is recognized by the FAA and serves as a certificate of proficiency.

B. QUALIFICATIONS AND PROCEDURES

1. To initially qualify for the PRO Rating, an applicant must:
   a. be a current member of USPA
   b. possess a USPA D license
   c. have at least 500 jumps on a ram-air type canopy
   d. make ten pre-declared jumps into a circle ten meters in diameter (landing within five meters of the center point) using the same canopy and must:
      (1) declare each jump
         (i) Pre-declared means that the applicant must announce the purpose of each of these ten jumps prior to making each one.
      (2) They do not have to be successive jumps.
      (3) If a jump is not pre-declared then it does not count for or against meeting the requirements.
   e. make the first contact and stop within the ten-meter circle and make all landings standing up
   f. make all jumps in front of at least three witnesses, one of whom is an S&TA, Instructor Examiner, or USPA Regional or National Director
   g. obtain signatures for each of the ten jumps
   h. score at least 75% on the PRO Rating exam
   i. forward the completed application form to his or her USPA Regional Director for his signature and include:
      (1) a 1” x 1” full face photo of the applicant
      (2) the completed PRO Rating exam
      (3) the rating fee

2. The USPA Regional Director will forward the initial application to USPA Headquarters.

3. Conditions
   a. The smallest canopy used during qualification will be the smallest size canopy to be used for minimum landing area (Level 2) jumps, and the canopy size will be noted on the PRO Rating card.
   b. USPA will issue an annual PRO Rating expiring not less than 12 months from the last date on the rating application.
   c. If a PRO Rating holder’s competence is questioned by a FAA or USPA official (including S&TAs), the PRO Rating holder may be required to reaffirm his or her proficiency.
   d. To requalify on a smaller canopy:
      (1) The rating holder must make three successive, pre-declared jumps, making the first contact and stopping within a circle ten meters in diameter with that canopy.
      (2) All landings must be made standing up and be verified by an S&TA, I/E, USPA Judge, or a Regional or National Director.

4. Annual renewal requirements: Within the previous 12 months the PRO holder must perform all the following verified by the signature of a current S&TA, I/E, USPA Judge or Board member (you may not renew yourself) and forward a completed PRO renewal application to USPA Headquarters:
   a. Make at least 50 jumps.
   b. Submit a 1” x 1” full face photo.
      (1) optional
      (2) incurs an additional charge for a new card
   c. Include the current renewal fee.
d. and either of the following:
   (1) perform a stand-up landing, making the first contact and stopping within a circle ten meters in diameter (landing within five meters of the center) in the presence of a current Regional-, National-, or FAI-rated judge; Regional or National Director; S&TA, or I/E
   (2) perform a Level 2 (as defined by USPA and accepted by the FAA) demo jump in the presence of any of the above mentioned USPA officials

5. Lapsed PRO Rating renewal requirements
   a. In the event that a PRO Rating holder allows his or her rating to lapse for two years or longer, the initial landing qualification requirements must be met.
   b. The canopy used for requalification will be the smallest-sized canopy to be used for minimum landing area (Level 2) jumps.
   c. The canopy size will be noted on the PRO Rating card.
INSTRUCTIONS FOR COMPLETING FAA FORM 7711-2

(FROM FAA ADVISORY CIRCULAR 91-45C)

1. Preparing FAA Form 7711-2. Items from the form are discussed below for purposes of clarity and uniformity of its use.
   a. Items 1 and 2, Name of Organization/Name of Responsible Person. If you are a representative of an organization, then the organization's name should appear in Item 1 and your name, as the organization's representative, for application purposes should appear in Item 2. If you are not representing an organization, the term N/A should be entered in Item 1 and the applicant's name in Item 2.
   b. Item 3, Permanent Mailing Address. Self-explanatory.
   c. Item 4, FAR Section and Number to be Waived. (1) All applicable FAR sections and numbers must be listed in this item. If you are unsure which FAR sections have to be waived, consult the FSDO for guidance before filling out this section. (2) An application for a parachuting operation should state that authorization is requested in accordance with FAR 105.15 or 105.19.
   d. Item 5, Detailed Description of Proposed Operation. It is sufficient to use the terms “air-show,” “aerobatic contest,” “aerobatic practice area,” “parachute demonstration jump,” or “air race” to describe the event.
   e. Item 6, Area of Operation. The description must depict the flight maneuvering area as a cubic or cylindrical cell of airspace, e.g., “a rectangle bounded by the N/S runway (or other definable geographical reference) and a point 5,000 feet east from the surface to 7,000 feet.” At off-airport sites, the boundaries should be described using easily identifiable landmarks. Current, properly marked charts, maps, drawings, or photographs of the area of operation (not required for parachute demonstration jumps at aviation events) must accompany the application. The FAA recommends that sponsors use a 7.5 series Topographic Quadrangle Map, published by the U.S. Geological Survey (Scale 1:24,000). Any depiction submitted must include scale indications of the flight lines, showlines, race courses, the location of the aviation event control point, police dispatch, ambulance, and firefighting equipment. Photographs and to-scale diagrams may be submitted as supplemental material to aid in the FAA's evaluation of a particular site. All flight operations conducted under the waiver shall be limited to the area defined in the FAA-approved application.
   f. Item 7, Time Period. List the dates requested for the aviation event and for any press previews that are scheduled. Alternate event dates should also be included in this item.
   g. Item 8, Aircraft Make and Model. If the type of aircraft and/or the names of the pilots are not known at the time the application is submitted, the FAA shall accept the application with a statement, “list of aircraft and/or pilot's names will be furnished on [date.]” Once the list has been supplied, last-minute Substitutions (parachutists or pilots) must show appropriate qualifications to the FAA inspector-in-charge at the aviation event before they are allowed to perform.
   h. Item 9, Sponsorship. Self-explanatory.
   i. Item 10, Permanent Mailing Address of Sponsor Self-explanatory.
   j. Item 11, Policing. Furnish a detailed explanation of how crowd control will be handled.
   k. Item 12, Emergency Facilities. (1) Place an “X” in the appropriate box or boxes. (2) Other: A sponsor seldom needs to fill in this block. However, the following is an example of how the “Other” block might prove useful. In one event, the sponsor had a helicopter and pilot continually ready for emergency transportation of spectators or performers who might be injured on the airport or who may become ill during the event. Additionally, a military-trained firefighter and a medic were standing by the helicopter with extinguishers in case an aircraft had an accident anywhere in the operating area. In this particular case, by describing this “Other” emergency facility, the applicant could have been relieved of having to show anything in the preceding blocks.
   l. Item 13, Air Traffic Control. Describe the method or methods of radio communication frequencies and/or the prearranged ground-to-air signals to be used during the aviation event. A description of the ground-to-air recall signal must also be included.
   m. Item 14, Schedule of Events. List the performers in the order that they will appear. (See paragraph 19 this AC for more detail.)
   n. Item 15, Certification. The applicant must sign in this block and on each page of the application.
Section Summary:

USPA presents awards to individual members in recognition of their accomplishments in skydiving. These awards programs have been established to provide both goals and recognition in a variety of fields. Each of these awards represents a significant milestone achieved by an individual skydiver.

Service awards are reserved for special USPA members whose contributions to the organization and the sport meet the criteria established by the award.

Achievement awards are earned by accumulating numbers of jumps (by thousands) or freefall time (12-hour increments).

Performance awards are presented for accomplishments in freefall and canopy formations.

Tenure awards are granted for longevity, measured by years of USPA membership.

Important Reference Numbers

- recipients of the USPA Achievement Award and Gold Medal for Meritorious Achievement—8-1
- rules for freefall sequential formation awards, large freefall formation awards, multi-discipline awards, and canopy formation awards—8-3

Who needs this section?

- jumpers applying for USPA awards
- jumpers nominating others for USPA awards
- USPA officials verifying awards
- USPA Board members seeking procedures for awards nominations and selection
- anyone interested in reviewing some of the most notable USPA members over the years
THIS PAGE INTENTIONALLY LEFT BLANK
SERVICE AWARDS

A. USPA Achievement Award

1. Introduction
   a. Perhaps the most respected honor which is offered by the United States Parachute Association is the USPA Achievement Award, which was originally conceived and created in 1970, as a result of an initial gift of $3,000 from an “Anonymous Donor.”
   b. The fund was eventually enlarged to a total of $30,000 over a period of years and the funds were placed on deposit with the National Aeronautic Association, which agreed to administer them on behalf of the United States Parachute Association, for the purpose of underwriting the cost of a variety of perpetual competition trophies, as well as the Achievement Award.
   c. The fund ceased to exist in 1982 when the final money available was used to construct the floor-to-ceiling display cases at USPA’s new Headquarters in Alexandria, Virginia, in which all USPA trophies are now displayed.
   d. The agreement signed on May 13, 1970, between Attorney John Kerr Wilson, acting for the “Anonymous Donor,” General Brooke E. Allen, Executive Director of the National Aeronautic Association, acting for the National Aeronautic Association; and Dr. Edward A. Fitch, president of the United States Parachute Association, acting for USPA, stipulates (among other things) that at any time on or after May 13, 1975, the “Anonymous Donor” may identify himself and direct that any and all awards created through his gift carry his name. To date the “Anonymous Donor” has not seen fit to exercise this privilege.

2. Qualifications for the award: The May 13, 1970, agreement, as accepted by USPA, describes the award itself and the qualifications required of recipients, using this language:

   “To provide a bowl or other suitable trophy to be known initially as ‘The United States Parachute Association Achievement Award’, which shall be perpetual and will be awarded annually to an expert active or retired sport parachute jumper in recognition of outstanding sportsmanship, skill, or personal contribution to the sport of parachuting and the United States Parachute Association, its goals and purposes. The recipient of such award will be selected by the board of directors by a majority vote during a closed regular or special meeting. In the event a majority of the board of directors cannot agree upon a recipient of such award on account of a lack of preeminence of the sport parachutist in any one year, the award will be made at least once each two years. Such trophy will be kept permanently in an appropriate location to be determined by the board of directors.”

3. Description of trophy:
   a. The trophy itself is a sterling silver bowl, 15 inches in diameter, seated on an octagonal teakwood base which bears carved wooden replicas of the USPA emblem on four faces and sterling silver plates listing the names and qualifications of recipients of the award on the other four faces.
   b. Traditionally, each year the recipient receives a smaller, eight-inch diameter replica silver bowl as his or her personal possession.

4. Other considerations:
   a. Following the vote of the USPA Board of Directors selecting a recipient, the Chair of the USPA Membership Services Committee or some other volunteer prepares an article for Parachutist Magazine explaining the merits of the recipient and the reasons for the decision of the board.
   b. The award is presented at an appropriate occasion where many USPA members are likely to be present.
   c. Traditionally the award is made for the year prior to the year in which it is presented.
   d. While the deed of gift requires that the award be given only to an individual, in 1974, the presentation was made to the United States Army Parachute Team, which suggests that the language in the deed is usable more as a guideline than as a strict requirement.
   e. The Membership Services Committee and the board has usually regarded the statement, “In recognition of personal contribution to the United States Parachute Association, its goals and purposes” as an overriding requirement (i.e., achievements in sport parachuting unrelated to the United States Parachute Association would normally not be considered sufficient to qualify a recipient, lacking specific contributions to USPA).
   f. While the deed of gift states that the award must be made at least once every two years, neither in 1991 nor in 1992 was a recipient named, thereby again suggesting that this particular language serves more as a guideline than as a requirement.
   g. No current member of the USPA Board of Directors may be recommended for the USPA Achievement Award during his or her term as a member of the board.
      (1) In practice, this requirement has been extended to forbid a nomination for at least two full years after the end of board service.
      (2) It is enlarged to include as ineligible current or former USPA employees, also until at least two years after their employment ends.
B. USPA Gold Medal for Meritorious Achievement

1. Background:
   a. Second only to the USPA Achievement Award in prestige, the USPA Gold Medal for Meritorious Achievement was established on July 13, 1997, by the USPA Board of Directors.
   b. The award given to the recipient is in the form of a struck brass medal which measures three inches in diameter, weighs approximately five ounces and is slotted at the top for attachment of a 30-inch gold fabric ribbon.
   c. For permanent display at USPA Headquarters is a large wooden plaque measuring two feet by four feet and adorned with an exact replica of the medal along with brass metal strips bearing the name and date of each recipient.

2. Criteria for the award:
   a. The USPA Gold Medal for Meritorious Achievement is to honor outstanding Americans who, by their efforts over a period of years, have made significant contributions to the skydiving community.
   b. Each recipient must be a U.S. citizen and been active in sport parachuting for at least 20 years in the areas of, but not limited to judging, instruction, jumpmastering, camera (film and video), competition, and safety.
   c. No current member of the USPA Board of Directors may be considered for the award and no past member of the board of directors of USPA may be considered for the award until at least two years after retiring from the board.
   d. No current employee of USPA may be considered for the award and no past employee of USPA may be considered for the award until at least two years after leaving USPA employment.

3. Nomination due date: Nominations must be received at USPA Headquarters no later than 60 days before the summer USPA Board of Directors meeting.

4. Selection committee: Nominees for the USPA Gold Medal for Meritorious Achievement will be selected by the USPA Membership Services Committee.

5. Selection process:
   a. The selection committee will present to the USPA Board of Directors those persons selected for consideration to receive the medal.
   b. The USPA Board of Directors will elect at its summer meeting, by a two-thirds majority and secret ballot in closed session, the recipients for the year being considered from those nominations presented by the selection committee.

6. Presentation of the award: The USPA Gold Medals for Meritorious Achievement are presented annually at a time and place selected by the president of the United States Parachute Association.

7. Nomination Procedures:
   a. Identify the nominee, including address and telephone number.
   b. Prepare the citation in 30 words or less capturing the essence of the achievement for which the nominee’s name has been submitted.
   c. Give complete, concise details justifying the award to the nominee, with pertinent background information to assist the selection committee.

C. National and International Aviation Awards

1. Background:
   a. The USPA Membership Services Committee is charged by the USPA Board of Directors with the preparation of recommendations of USPA members who are eligible for major national and international awards, medals, and other special recognitions.
   b. Final action on these recommendations is the responsibility of the full board of directors, but all members of the association are invited to suggest nominees for any and all awards.
   c. The Membership Services Committee will consider only nominees who have served the cause and interests of skydiving in general and the USPA in particular.
   d. The Membership Services Committee will recommend to the full board not more than one candidate for each major award each year.
   e. No current member of the USPA Board of Directors will be recommended for any award during the term of office.

2. Principal national and international awards for which members are eligible:
      (1) Annual awards of the FAI carry world-wide distinction.
      (2) Skydivers are eligible for only two of the various FAI citations: the Tissandier Diploma and the Group Diploma of Honor.
         (i) The Tissandier Diploma is usually awarded to an individual.
         (ii) The Group Diploma of Honor, as its name implies, honors achievement by groups or organizations.
      (3) Both are awarded for “during the previous years, serving the cause of aviation in general, and private and sporting aviation in particular, by their work, initiative, and devotion in other ways.”
   b. The Leonardo da Vinci Diploma and the FAI Parachuting Gold Medal are special awards for which only parachutists are eligible and which are awarded by the International Parachuting Committee (IPC) each year.
(1) The Leonardo da Vinci Diploma is awarded by the IPC to a male or female parachutist who has (any of the following):

(i) at least three times consecutively won a National Overall Championship title

(ii) at least once won the World Absolute Individual Parachuting Championship and twice the title of Combined Champion (male or female) at a recognized international parachuting competition

(iii) served twice as chief judge at a recognized international competition and at least once at a recognized World Parachuting Championships, or served at least three times consecutively as an international judge at a recognized World Parachuting Championships

(iv) established at least three world parachuting records

(v) served at least twice as meet director at a recognized international parachuting competition and at least once at a recognized World Parachuting Championship

(vi) been nominated as honorary president of the International Parachuting Committee (IPC)

(vii) served for at least ten consecutive years, including the current year, as a national delegate to the IPC

(2) Only one Leonardo da Vinci Diploma is awarded annually, and each year each active member of the FAI may propose one candidate from his or her country, such submission to be signed by the president or vice president of the FAI member organization.

c. The Parachuting Gold Medal

(1) This distinction is awarded annually by the IPC to honor “an outstanding accomplishment in connection with parachuting,” which “could be in the realm of sport, safety, or … an invention.”

(2) Each year each active FAI member may propose one candidate from his country, who however may not be a currently seated member of the IPC, such submission to be in writing and signed by the president or vice president of the FAI member organization.

d. The Frank G. Brewer Trophy of the National Aeronautic Association (NAA).

(1) The NAA, U.S. representative of the FAI, itself sponsors certain coveted awards in the American aviation world.

(2) Among these is the Frank G. Brewer Trophy, for which nominations are accepted from any division of NAA.

(3) The Brewer Trophy, awarded annually, is given to an individual, group or organization “for the most outstanding contribution to the development of air youth in the field of education and training.”

e. The Leo Stevens Medal of the Leo Stevens Award Committee: The Leo Stevens Award Committee, an independent group not affiliated with FAI or NAA, describes the medal as the “principal parachuting award,” given annually to the “individual or group who has made the most distinguished contribution to the saving of lives in aerial navigation by perfecting the parachute or other means of bringing individuals or disabled aircraft in safely to the ground, or in training and developing the art and use of such means.”

3. Procedures:

a. After a review of all nominees proposed, the Membership Services Committee will present to the full board a list of those nominees for which the board’s endorsement is requested.

b. All such nominees should be presented to the USPA Board for approval at its winter meeting.

c. If the USPA Board approves:

(1) Not later than April 1 of each year, the chair of the Membership Services Committee will forward appropriate letter of recommendation in support of each candidate endorsed by the USPA Board, together with necessary supporting documents and evidence to:

(i) FAI Headquarters
    Avenue Mon Repos 24
    1005 Lausanne, Switzerland

(ii) to the NAA or the Leo Stevens Award Committee as directed by NAA or the Stevens Committee

(2) The chair will then follow up personally if necessary with each of the aviation organizations sponsoring the various national and international awards to ensure that USPA nominees are properly evaluated.
Note: In absent years, no award was presented.

1971 Joe Crane (posthumously)—“For unselfish and dedicated service as founder, president, and chairman of the board of the National Parachute Jumpers and Riggers and its successor, the Parachute Club of America.”

1972 Lew Sanborn, D-1—“For originating safe and reliable parachute equipment, for pioneering work in freefall photography, and for many other contributions to the sport and USPA.”

1973 Steve Snyder, D-5—“For pioneering contributions through the years to the saving of lives and the improvement of parachute equipment.”

1974 United States Army Parachute Team—“Generous and dedicated sportsmen, celebrated competitors, respected leaders who since 1961 have introduced parachuting at its best to worldwide millions and have brought honor and distinction to the sport.”

1975 Lowell Bachman—“For service to the United States Parachute Association and all competitors as judge and chief judge at countless national championships, and as a dedicated leader in the development of judging excellence.”

1977 Russ Gunby—“A founding spirit who saw the future when others doubted. As author, executive director, and P.C.A. president, he gave countless hours to build the early framework of our sport.”

1978 Len Potts—“In recognition of personal sacrifice and countless contributions to skydiving and this organization spanning our decades as a sport. His past is our present.”

1980 Dan Poynter—“Prolific author, distinguished instructor, preeminent parachutist, whose service to skydiving spans more than 20 active years.”

1981 Norman E. Heaton—“In eleven years of devoted service as executive director, he contributed substantially and uniquely to USPA’s greatest growth.”

1983 James F. “Curt” Curtis—“A total contributor to our sport and USPA: competitive champion, headquarters executive, drop zone owner, safety officer, director, board chairman.” [For some reason, his service as USPA president was not recorded.]

1984 Chuck MacCrone—“In recognition of outstanding contributions to sport parachuting and as a testament to his unparalleled service as president, FAI-IPC.”

1987 Carl Boenish (posthumously)—“A prolific and talented skydiver whose lifetime of pioneering freefall photography brought unforgettable images and better understanding to fellow jumpers and the public.”

1989 J. Scott Hamilton—“For service to USPA and the skydiving world 1967-1979, a Collegiate League director, Safety and Training Committee chairman, and USPA president.”

1990 Ken Coleman (posthumously)—“World and national champion who created the accelerated freefall program.”

1993 Loy Brydon, D-12—“In recognition of major contributions to parachuting in the development of equipment, freefall techniques and competition—an original role model of the total skydiver.”

1994 William H. Ottley, D-298—“In recognition of more than three decades of dedicated service to skydiving and USPA, as board member, vice president and executive director.”

1995 Dick Barber, C-2375—“For dedicated service to all competitors as a judge at countless U.S. Nationals and world championships, and for the inspiration provided to judges.”

1997 Clint Vincent—“Selfless service for the betterment of all aspects of skydiving and in support of all skydivers.”

1998 Patrick M. Moorehead—“For unselfish dedication to the United States Parachute Association since 1969 as an ambassador extraordinaire while traveling the world as a member of the board of directors and as a professional skydiving performer.”
1997 Lorrie Young—“In recognition of outstanding achievement as a National and International Judge in all skydiving disciplines. Her unwavering dedication to fairness and integrity brought honor, as well as equality, to the judging profession.”

1999 Jimmy Godwin—“For outstanding and meritorious service to the skydiving community and for sharing his knowledge for over three decades as a Drop Zone owner, rigger examiner, pilot, instructor, and Conference Director.”

1999 Jerry Bird—“For outstanding and meritorious service to the skydiving community for over thirty years, inspiring jumpers into becoming competitors and for unselfish training and organizing in the field of relative work.”

2000 Sandra Williams—“For your unparalleled encouragement to women’s participation in skydiving and helping set the benchmark for achievement in our sport.”

2001 Dave DeWolf—“In recognition of your decades of service to the sport as a rigging school operator, seminar host and mentor.”
A. ACHIEVEMENT AWARDS FOR JUMP EXPERIENCE  
1. These two types of freefall awards are intended to provide a special kind of recognition to those United States Parachute Association members who have accumulated significant levels of experience in both number of freefall skydives and amount of freefall time. 
2. USPA proudly recognizes those members.

B. CUMULATIVE JUMPS AND FREEFALL TIME  
1. Accumulated freefall jumps:
   a. Gold Expert Wings are awarded for 1,000 freefall skydives.
   b. Diamond Expert Wings are awarded for each multiple of 1,000 freefall skydives up to 10,000.
   c. Ruby Expert Wings are awarded for each multiple of 1,000 freefall skydives from 11,000 to 19,000.
   d. Emerald Expert Wings are awarded for each multiple of 1,000 freefall skydives from 20,000 to 29,000.
   e. Sapphire Expert Wings are awarded for each multiple of 1,000 freefall skydives from 30,000 to 39,000.
2. Accumulated freefall time:
   a. Gold Freefall Badges are awarded for 12 hours of freefall time.
   b. Diamond Freefall Badges are awarded for each multiple of 12 hours of freefall time up to 120 hours.
   c. Ruby Freefall Badges are awarded for each multiple of 12 hours of freefall time from 132 hours up to 228 hours.
   d. Emerald Freefall Badges are awarded for each multiple of 12 hours of freefall time from 240 hours up to 348 hours.
   e. Sapphire Freefall Badges are awarded for each multiple of 12 hours of freefall time from 360 hours up to 468 hours.

C. GENERAL REQUIREMENTS  
1. To be eligible for any of these awards a person must:
   a. have completed the required number of freefall skydives or accumulated the required amount of freefall time
   b. have made each jump being presented as qualification in compliance with the USPA BSRs
   c. be a current USPA member at the time of application for the award
   d. be the holder of a current USPA D license or its accepted foreign equivalent
   e. have no record of a BSR violation on file with USPA
   f. have met the requirements of the previous award
2. Logging:
   a. The applicant must present logbook evidence of the required number of freefall skydives or amount of freefall time for which the award is being made.
   b. For jumps made after December 31, 1987, each jump must be listed as a separate entry and contain at least:
      (1) the jump number
      (2) date
      (3) location
      (4) exit altitude
      (5) freefall length
      (6) type of jump (formation skydiving, accuracy, jumpmaster, photography, etc.)
      (7) signatures of witnessing jumpers or pilots (encouraged but not required)
3. Verification of the required number of freefall skydives or freefall time and other requirements will be made by:
   a. a USPA Regional or National Director
   b. a USPA administrative officer
   c. in case of hardship or extraordinary conditions, other persons deemed acceptable to USPA Headquarters or the USPA Board of Directors

5. The verifying official will submit to USPA Headquarters a completed application verifying that the applicant has met all requirements.
6. Upon receipt of the completed application, USPA Headquarters will issue the award as directed by the verifying official.
7. All awards will be issued by USPA Headquarters in the order the qualified application is received.
8. In the case of special circumstances or hardships, waiver of these requirements and procedures may be applied for through the USPA Board of Directors.

D. PRESENTATION  
1. Because of the particular significance of the milestone represented by the award of Gold, Diamond, Ruby, Emerald, and Sapphire Expert Wings and Freefall Badges, it is in the best interest of the United States Parachute Association and the sport of skydiving that these awards be presented to the recipient with appropriate ceremony and recognition.
2. Except when not practical, these awards should be presented by a USPA National or Regional Director, to whom the award will normally be entrusted before presentation.
3. It is also recommended and urged that all recipients of Gold, Diamond, Ruby, Emerald, and Sapphire Expert Wings and Badges be publicized as widely as possible through skydiving publications and local news media.
4. Whenever possible, a brief report and photograph of the presentation should be submitted to:

**A. AWARDS FOR SKYDIVING SKILL**

The performance awards program is an international awards program of the United States Parachute Association.

1. Freefall performance awards
   a. The Falcon, Eagle, Silver Falcon, Golden Eagle, and 3-D awards recognize each applicant's progression towards higher levels of freefall body control and awareness.
   b. The Falcon and Eagle Award coincide with certain license requirements.

2. Canopy formation performance awards
   a. These awards recognize each applicant's progression towards higher levels of canopy control, maneuverability, and proficiency.
   b. In receiving and exhibiting these awards, the recipient agrees to exercise good judgement and wisdom in promoting safe canopy relative work among his or her peers, among those less experienced than himself or herself, and toward observers of the sport.

**B. PREREQUISITES**

1. Each applicant must be either a current USPA member or a member of another FAI Aero Club.
2. Jumps used to qualify for these awards are to comply with the USPA Basic Safety Requirements.

**C. APPLICATION**

Send the completed application to

USPA Headquarters
1440 Duke Street
Alexandria, VA 22314

or fax to (703) 836-2843 and include:

1. Falcon and Eagle:
   a. the applicant's name as it is to appear on official certificates
   b. the location of the jump: city, state, country (if not USA)
   c. diagram or name of each completed formation
   d. a list of the other participants (signatures not required)
   e. the date of the jump that qualified the applicant for the award
   f. the number of points scored on the skydive
   g. the award applied for
   h. the appropriate fee for the award and any additional materials requested, such as decals, pins, or additional certificates

2. Silver Falcon and Golden Eagle:
   a. the applicant's name as it is to appear on official certificates
   b. the location of the jump: city, state, country (if not USA)
   c. a list of the other participants (signatures not required)
   d. the date of the jump that qualified the applicant for the award
   e. Diagram or photograph of the completed formation
   f. the award applied for
   g. the appropriate fee for the award and any additional materials requested, such as decals, pins, or additional certificates

3. 3-D:
   a. application information
      (1) the applicant's name as it is to appear on official certificates
      (2) the location of the jump: city, state, country (if not USA)
      (3) a list of the other two participants and the videographer, if applicable (signatures not required)
      (4) the date of the jump that qualified the applicant for the award
      (5) the appropriate fee for the award and any additional materials requested, such as decals, patches, or additional certificates
   b. A USPA Safety & Training Advisor must verify that the maneuvers were completed as prescribed by observing them in freefall or on video and attest to their satisfactory completion by signature on the application form.

4. 4-Stack, CCR, and CCS, day and night:
   a. the applicant's name as it is to appear on official certificates
   b. the location of the jump: city, state, country (if not USA)
   c. diagram or name of each completed formation
   d. a list of the other participants (signatures not required)
   e. the date of the jump that qualified the applicant for the award
   f. the holding time for the formation
   g. the award applied for
   h. the appropriate fee for the award and any additional materials requested, such as decals, pins, or additional certificates
8-3.1 FALCON AWARD

1. The Falcon Award is available to those who have successfully participated in a four-person or larger sequential freefall skydive during which at least eight points were completed.

2. Qualification:
   a. The formations completed for this award may come from the USPA Skydiver's Competition Manual or may be other formations.
   b. Complete separation between each formation is required.
   c. All formations must be planned in advance.
   d. All participants must be in position and on grips for the formation to be considered complete.
   e. Formations may be launched from the aircraft.

8-3.2 EAGLE AWARD

1. The Eagle Award is available to those who have successfully participated in an eight-person or larger sequential freefall skydive during which at least four points were completed.

2. Qualification:
   a. The formations completed for this award may come from the USPA Skydiver's Competition Manual or may be other formations.
   b. Complete separation between each formation is required.
   c. All formations must be planned in advance.
   d. All participants must be in position and on grips for the formation to be considered complete.
   e. Formations may be launched from the aircraft.

8-3.3 SILVER FALCON AWARD

1. The USPA Silver Falcon Award is available to those who have successfully participated in a 36-person or larger freefall skydiving formation.

2. Qualifications:
   a. All formations must be planned in advance.
   b. All participants must be in position and on grips for the formation to be considered complete.
   c. Formations may be launched from the aircraft.
   d. The completed formation must be held for a minimum of three seconds.

8-3.4 GOLDEN EAGLE AWARD

1. The USPA Golden Eagle Award is available to those who have successfully participated in a 64-person or larger freefall skydiving formation.

2. Qualifications:
   a. All formations must be planned in advance.
   b. All participants must be in position and on grips for the formation to be considered complete.
   c. Formations may be launched from the aircraft.
   d. The completed formation must be held for a minimum of three seconds.

8-3.5 3-D AWARD

1. The 3-D Award is available to those who have completed three assigned maneuvers with two other skydivers in each the head-down, sitting, and horizontal positions.

2. Qualification: The maneuvers must be completed in order and as follows:
   a. head-down
      (1) right or left-hand flower
      (2) round
      (3) opposite-hand flower
   b. sitting: right- or left-hand vertical stairstep with two rotations, such that each jumper does one point at the top
   c. horizontal (belly to earth)
      (1) compressed accordion
      (2) individual 180-degree turns
      (3) opposite compressed accordion
      (4) round
   d. There must be clear separation between each maneuver, although the first formation may be launched from the aircraft.
   e. An S&TA must observe the maneuvers or review the video to verify completion.

8.3.6 CANOPY FORMATION AWARDS

A. AWARDS

1. The 4-Stack Award is available for building a canopy formation of four or more canopies.
2. The CCR (Canopy Crest Recipient) or 8-Stack Award is available for building a canopy formation of eight or more canopies.
3. The CCS (Canopy Crest Solo) Award is available for entering eighth or later in a complete eight-canopy or larger formation.
4. Night versions of each of these awards are available for those who have completed these formations at night.

B. QUALIFICATIONS

1. The formations completed for this award may come from the USPA Skydiver's Competition Manual or may be other recognizable formations.
2. All formations must be planned in advance.
3. All participants must be in position and on grips for the formation to be considered complete.
4. The completed formation must be held for a minimum of ten seconds.
A. TENURE AWARDS

1. Membership tenure certificates are issued to acknowledge support of skydiving through membership in USPA for significant periods of time.

2. USPA membership tenure certificates are issued at the completion of ten years of accumulated membership and at each five years thereafter.

B. QUALIFICATIONS

1. Computation of tenure:
   a. The ten-year certificate is issued when a full ten years of membership has been accumulated.
   b. In other words, the certificate is issued at the end of the tenth year of membership.
   c. Lapses in membership are subtracted from the total time of membership.
   d. Membership records are adjusted by changing the “member since” date to reflect periods of expired membership.

2. Certificates are issued automatically whenever a member’s records indicate an accumulation of the appropriate amount of time.
section nine

FAA DOCUMENTS

Section Summary:

The Federal Aviation Administration (FAA) of the U.S. Department of Transportation has the responsibility for regulating airspace usage in the United States. Concerning skydiving activities, the FAA fulfills this responsibility by specifically regulating certain aspects of skydiving and by relying upon the self-regulation of the participants through the guidelines and recommendations published by USPA.

The FAA’s main responsibility is to provide for the safety of air traffic, as well as persons and property on the ground. The FAA does this by certificating pilots, mechanics, air traffic controllers and parachute riggers and by requiring approval data for aircraft and parachutes. The agency has the authority to impose fines and suspend or revoke certificates it has issued. In the case of a skydiving violation, the FAA can fine the pilot, rigger, and the jumpers, as well as suspend or revoke the certificates of pilots and riggers.

The FAA relies upon self policing from within the skydiving community for most training and operational requirements.

Important Reference Numbers

- FAR Part 61 (excerpts), pilot certification
- FAR Part 65 (excerpts), parachute riggers
- FAR 91 (excerpts), general flight rules pertaining to skydiving operations
- FAR Part 105 (all), skydiving
- FAR Part 119 (excerpts), limits of jump flights
- AC 90-66, multi-users at uncontrolled airports
- AC 91-45 (excerpts), airshows

Who needs this section?

- jumpers studying for licenses and ratings
- jumpers planning exhibition jumps or jumps off the regular DZ
- parachute riggers and packers
- jump pilots
- drop zone management
Part 61—Certification: Pilots, Flight Instructors, and Ground Instructors

Subpart A—General

Sec. 61.1 Applicability and Definitions

(a) This part prescribes:
   (1) The requirements for issuing pilot, flight instructor, and ground instructor certificates and ratings; the conditions under which those certificates and ratings are necessary; and the privileges and limitations of those certificates and ratings.
   (2) The requirements for issuing pilot, flight instructor, and ground instructor authorizations; the conditions under which those authorizations are necessary; and the privileges and limitations of those authorizations.

Sec. 61.3 Requirement for Certificates, Ratings, and Authorizations

(a) Pilot certificate. A person may not act as pilot in command or in any other capacity as a required pilot flight crewmember of a civil aircraft of U.S. registry, unless that person has a valid pilot certificate or special purpose pilot authorization issued under this part in that person’s physical possession or readily accessible in the aircraft when exercising the privileges of that pilot certificate or authorization. However, when the aircraft is operated within a foreign country, a current pilot license issued by the country in which the aircraft is operated may be used.

(c) Medical certificate.
   (1) Except as provided for in paragraph (c)(2) of this section, a person may not act as pilot in command or in any other capacity as a required pilot flight crewmember of an aircraft, under a certificate issued to that person under this part, unless that person has a current and appropriate medical certificate that has been issued under part 67 of this chapter, or other documentation acceptable to the Administrator, which is in that person’s physical possession or readily accessible in the aircraft.
   (l) Inspection of certificate. Each person who holds an airman certificate, medical certificate, authorization, or license required by this part must present it for inspection upon a request from:
      (1) The Administrator;
      (2) An authorized representative of the National Transportation Safety Board; or
      (3) Any Federal, State, or local law enforcement officer.

Sec. 61.23 Medical Certificates: Requirement and Duration

(a) Operations requiring a medical certificate. Except as provided in paragraph (b) of this section, a person:
   (1) Must hold a first-class medical certificate when exercising the privileges of an airline transport pilot certificate;
   (2) Must hold at least a second-class medical certificate when exercising the privileges of a commercial pilot certificate; or

(c) Duration of a medical certificate.
   (1) A first-class medical certificate expires at the end of the last day of—
      (i) The sixth month after the month of the date of examination shown on the certificate for operations requiring an airline transport pilot certificate;
      (ii) The 12th month after the month of the date of examination shown on the certificate for operations requiring a commercial pilot certificate or an air traffic control tower operator certificate; and
      (iii) The period specified in paragraph (c)(3) of this section for
   (2) A second-class medical certificate expires at the end of the last day of—
      (i) The 12th month after the month of the date of examination shown on the certificate for operations requiring a commercial pilot certificate or an air traffic control tower operator certificate …

Sec. 61.51 Pilot Logbooks

(a) Training time and aeronautical experience. Each person must document and record the following time in a manner acceptable to the Administrator:
   (1) Training and aeronautical experience used to meet the requirements for a certificate, rating, or flight review of this part.
   (2) The aeronautical experience required for meeting the recent flight experience requirements of this part.

Sec. 61.56 Flight Review

(c) Except as provided in paragraphs (d), (e), and (g) of this section, no person may act as pilot in command of an aircraft unless, since the beginning of the 24th calendar month before the month in which that pilot acts as pilot in command, that person has—
   (1) Accomplished a flight review given in an aircraft for which that pilot is rated by an authorized instructor and
   (2) A logbook endorsed from an authorized instructor who gave the review certifying that the person has satisfactorily completed the review.
SEC. 61.57 RECENT FLIGHT EXPERIENCE: PILOT IN COMMAND

(a) General experience.
   (1) Except as provided in paragraph (e) of this section, no person may act as a pilot in command of an aircraft carrying passengers or of an aircraft certificated for more than one pilot flight crewmember unless that person has made at least three takeoffs and three landings within the preceding 90 days, and—
   (i) The person acted as the sole manipulator of the flight controls; and
   (ii) The required takeoffs and landings were performed in an aircraft of the same category, class, and type (if a type rating is required), and, if the aircraft to be flown is an airplane with a tailwheel, the takeoffs and landings must have been made to a full stop in an airplane with a tailwheel.

SUBPART E—PRIVATE PILOTS

SEC. 61.113 PRIVATE PILOT PRIVILEGES AND LIMITATIONS: PILOT IN COMMAND

(a) Except as provided in paragraphs (b) through (g) of this section, no person who holds a private pilot certificate may act as pilot in command of an aircraft that is carrying passengers or property for compensation or hire; nor may that person, for compensation or hire, act as pilot in command of an aircraft.

(b) A private pilot may, for compensation or hire, act as pilot in command of an aircraft in connection with any business or employment if:
   (1) The flight is only incidental to that business or employment; and
   (2) The aircraft does not carry passengers or property for compensation or hire.

(c) A private pilot may not pay less than the pro rata share of the operating expenses of a flight with passengers, provided the expenses involve only fuel, oil, airport expenditures, or rental fees.

SUBPART F—COMMERCIAL PILOTS

SEC. 61.133 COMMERCIAL PILOT PRIVILEGES AND LIMITATIONS

(a) Privileges—
   (1) General. A person who holds a commercial pilot certificate may act as pilot in command of an aircraft—
      (i) Carrying persons or property for compensation or hire, provided the person is qualified in accordance with this part and with the applicable parts of this chapter that apply to the operation; and
      (ii) For compensation or hire, provided the person is qualified in accordance with this part and with the applicable parts of this chapter that apply to the operation.

Part 65—Certification: Airmen other than Flight Crewmembers

SUBPART A—GENERAL

SEC. 65.1 APPLICABILITY

This part prescribes the requirements for issuing the following certificates and associated ratings and the general operating rules for the holders of those certificates and ratings:

(a) Air-traffic control-tower operators.
(b) Aircraft dispatchers.
(c) Mechanics.
(d) Repairmen.
(e) Parachute riggers.

SEC. 65.11 APPLICATION AND ISSUE

(a) Application for a certificate and appropriate class rating, or for an additional rating, under this part must be made on a form and in a manner prescribed by the Administrator. Each person who is neither a U.S. citizen nor a resident alien and who applies for a written or practical test to be administered outside the United States or for any certificate or rating issued under this part must show evidence that the fee prescribed in appendix A of part 187 of this chapter has been paid.

(b) An applicant who meets the requirements of this part is entitled to an appropriate certificate and rating.

(c) Unless authorized by the Administrator, a person whose air traffic control tower operator, mechanic, or parachute rigger certificate is suspended may not apply for any rating to be added to that certificate during the period of suspension.

(d) Unless the order of revocation provides otherwise—
   (1) A person whose air traffic control tower operator, aircraft dispatcher, or parachute rigger certificate is revoked may not apply for the same kind of certificate for 1 year after the date of revocation; and
   (2) A person whose mechanic or repairman certificate is revoked may not apply for either of those kinds of certificates for 1 year after the date of revocation.

SEC. 65.12 OFFENSES INVOLVING ALCOHOL OR DRUGS

(a) A conviction for the violation of any Federal or state statute relating to the growing, processing, manufacture, sale, disposition, possession, transportation, or importation of narcotic drugs, marihuana, or depressant or stimulant drugs or substances is grounds for—
   (1) Denial of an application for any certificate or rating issued under this part for a period of up to 1 year
after the date of final conviction; or
(2) Suspension or revocation of any certificate or rating issued under this part.

(b) The commission of an act prohibited by Sec. 91.19(a) of this chapter is grounds for—
(1) Denial of an application for a certificate or rating issued under this part for a period of up to 1 year after the date of that act; or
(2) Suspension or revocation of any certificate or rating issued under this part.

**SEC. 65.15 DURATION OF CERTIFICATES**

(a) Except for repairman certificates, a certificate or rating issued under this part is effective until it is surrendered, suspended, or revoked.

(b) Unless it is sooner surrendered, suspended, or revoked, a repairman certificate is effective until the holder is relieved from the duties for which the holder was employed and certificated.

(c) The holder of a certificate issued under this part that is suspended, revoked, or no longer effective shall return it to the Administrator.

**SEC. 65.16 CHANGE OF NAME:**

**REPLACEMENT OF LOST OR DESTROYED CERTIFICATE**

(a) An application for a change of name on a certificate issued under this part must be accompanied by the applicant’s current certificate and the marriage license, court order, or other document verifying the change. The documents are returned to the applicant after inspection.

(b) An application for a replacement of a lost or destroyed certificate is made by letter to the Department of Transportation, Federal Aviation Administration, Airman Certification Branch, Post Office Box 25082, Oklahoma City, OK 73125. The letter must—

(1) Contain the name in which the certificate was issued, the permanent mailing address (including zip code), social security number (if any), and date and place of birth of the certificate holder, and any available information regarding the grade, number, and place of issue of the certificate, and the ratings on it; and

(2) Be accompanied by a check or money order for $2, payable to the Federal Aviation Administration.

(c) An application for a replacement of a lost or destroyed medical certificate is made by letter to the Department of Transportation, Federal Aviation Administration, Civil Aeromedical Institute, Aeromedical Certification Branch, Post Office Box 25082, Oklahoma City, OK 73125, accompanied by a check or money order for $2.00.

(d) A person whose certificate issued under this part or medical certificate, or both, has been lost may obtain a telegram from the FAA confirming that it was issued. The telegram may be carried as a certificate for a period not to exceed 60 days pending his receiving a duplicate certificate under paragraph (b) or (c) of this section, unless he has been notified that the certificate has been suspended or revoked. The request for such a telegram may be made by prepaid telegram, stating the date upon which a duplicate certificate was requested, or including the request for a duplicate and a money order for the necessary amount. The request for a telegraphic certificate should be sent to the office prescribed in paragraph (b) or (c) of this section, as appropriate. However, a request for both at the same time should be sent to the office prescribed in paragraph (b) of this section.

**SEC. 65.17 TESTS: GENERAL PROCEDURE**

(a) Tests prescribed by or under this part are given at times and places, and by persons, designated by the Administrator.

(b) The minimum passing grade for each test is 70 percent.

**SEC. 65.18 WRITTEN TESTS:**

**CHEATING OR OTHER UNAUTHORIZED CONDUCT**

(a) Except as authorized by the Administrator, no person may—

(1) Copy, or intentionally remove, a written test under this part;

(2) Give to another, or receive from another, any part or copy of that test;

(3) Give help on that test to, or receive help on that test from, any person during the period that test is being given;

(4) Take any part of that test in behalf of another person;

(5) Use any material or aid during the period that test is being given; or

(6) Intentionally cause, assist, or participate in any act prohibited by this paragraph.

(b) No person who commits an act prohibited by paragraph (a) of this section is eligible for any airman or ground instructor certificate or rating under this chapter for a period of 1 year after the date of that act. In addition, the commission of that act is a basis for suspending or revoking any airman or ground instructor certificate or rating held by that person.

**SEC. 65.19 RETESTING AFTER FAILURE**

An applicant for a written, oral, or practical test for a certificate and rating, or for an additional rating under this part, may apply for retesting—

(a) After 30 days after the date the applicant failed the test; or

(b) Before the 30 days have expired if the applicant presents a signed statement from an airman holding the certificate and rating sought by the applicant, certifying that the airman has given the applicant additional instruction in each of the subjects failed and that the airman considers the applicant ready for retesting.

**SEC. 65.20 APPLICATIONS, CERTIFICATES, LOGBOOKS, REPORTS, AND RECORDS:**

**FALSIFICATION, REPRODUCTION, OR ALTERATION**
(a) No person may make or cause to be made—
   (1) Any fraudulent or intentionally false statement on any application for a certificate or rating under this part;
   (2) Any fraudulent or intentionally false entry in any logbook, record, or report that is required to be kept, made, or used, to show compliance with any requirement for any certificate or rating under this part;
   (3) Any reproduction, for fraudulent purpose, of any certificate or rating under this part; or
   (4) Any alteration of any certificate or rating under this part.

(b) The commission by any person of an act prohibited under paragraph (a) of this section is a basis for suspending or revoking any airman or ground instructor certificate or rating held by that person.

SEC. 65.21 CHANGE OF ADDRESS

Within 30 days after any change in his permanent mailing address, the holder of a certificate issued under this part shall notify the Department of Transportation, Federal Aviation Administration, Airman Certification Branch, Post Office Box 25082, Oklahoma City, OK 73125, in writing, of his new address.

SEC. 65.111 CERTIFICATE REQUIRED

(a) No person may pack, maintain, or alter any personnel-carrying parachute intended for emergency use in connection with civil aircraft of the United States (including the reserve parachute of a dual parachute system to be used for intentional parachute jumping) unless that person holds an appropriate current certificate and type rating issued under this subpart and complies with Secs. 65.127 through 65.133.

(b) No person may pack, maintain, or alter any main parachute of a dual-parachute system to be used for intentional parachute jumping in connection with civil aircraft of the United States unless that person—
   (1) Has an appropriate current certificate issued under this subpart;
   (2) Is under the supervision of a current certificated parachute rigger;
   (3) Is the person making the next parachute jump with that parachute in accordance with Sec. 105.43(a) of this chapter; or
   (4) Is the parachutist in command making the next parachute jump with that parachute in a tandem parachute operation conducted under Sec. 105.45(b)(1) of this chapter.

(c) Each person who holds a parachute rigger certificate shall present it for inspection upon the request of the Administrator or an authorized representative of the National Transportation Safety Board, or of any Federal, State, or local law enforcement officer.

(d) The following parachute rigger certificates are issued under this part:
   (1) Senior parachute rigger.
   (2) Master parachute rigger.

(e) Sections 65.127 through 65.133 do not apply to parachutes packed, maintained, or altered for the use of the armed forces.

SEC. 65.113 ELIGIBILITY REQUIREMENTS: GENERAL

(a) To be eligible for a parachute rigger certificate, a person must—
   (1) Be at least 18 years of age;
   (2) Be able to read, write, speak, and understand the English language, or, in the case of a citizen of Puerto Rico, or a person who is employed outside of the United States by a U.S. air carrier, and who does not meet this requirement, be issued a certificate that is valid only in Puerto Rico or while he is employed outside of the United States by that air carrier, as the case may be; and
   (3) Comply with the sections of this subpart that apply to the certificate and type rating he seeks.

(b) Except for a master parachute rigger certificate, a parachute rigger certificate that was issued before, and was valid on, October 31, 1962, is equal to a senior parachute rigger certificate, and may be exchanged for such a corresponding certificate.

SEC. 65.115 SENIOR PARACHUTE RIGGER CERTIFICATE: EXPERIENCE, KNOWLEDGE, AND SKILL REQUIREMENTS

Except as provided in Sec. 65.117, an applicant for a senior parachute rigger certificate must—

(a) Present evidence satisfactory to the Administrator that he has packed at least 20 parachutes of each type for which he seeks a rating, in accordance with the manufacturer’s instructions and under the supervision of a certificated parachute rigger holding a rating for that type or a person holding an appropriate military rating;

(b) Pass a written test, with respect to parachutes in common use, on—
   (1) Their construction, packing, and maintenance;
   (2) The manufacturer’s instructions;
   (3) The regulations of this subpart; and

(c) Pass an oral and practical test showing his ability to pack and maintain at least one type of parachute in common use, appropriate to the type rating he seeks.

SEC. 65.117 MILITARY RIGGERS OR FORMER MILITARY RIGGERS: SPECIAL CERTIFICATION RULE

In place of the procedure in Sec. 65.115, an applicant for a senior parachute rigger certificate is entitled to it if he passes a written test on the regulations of this subpart and presents satisfactory documentary evidence that he—

(a) Is a member or civilian employee of an Armed Force of the United States, is a civilian employee of a regular armed force of a foreign country, or has, within the 12 months before he applies, been honorably discharged or released from any status covered by this paragraph;
(b) Is serving, or has served within the 12 months before he applies, as a parachute rigger for such an Armed Force; and
(c) Has the experience required by Sec. 65.115(a).

SEC. 65.119 MASTER PARACHUTE RIGGER CERTIFICATE: EXPERIENCE, KNOWLEDGE, AND SKILL REQUIREMENTS

An applicant for a master parachute rigger certificate must meet the following requirements:

(a) Present evidence satisfactory to the Administrator that he has had at least 3 years of experience as a parachute rigger and has satisfactorily packed at least 100 parachutes of each of two types in common use, in accordance with the manufacturer's instructions—
(1) While a certificated and appropriately rated senior parachute rigger; or
(2) While under the supervision of a certificated and appropriately rated parachute rigger or a person holding appropriate military ratings.

An applicant may combine experience specified in paragraphs (a) (1) and (2) of this section to meet the requirements of this paragraph.

(b) If the applicant is not the holder of a senior parachute rigger certificate, pass a written test, with respect to parachutes in common use, on—
(1) Their construction, packing, and maintenance;
(2) The manufacturer's instructions; and
(3) The regulations of this subpart.

(c) Pass an oral and practical test showing his ability to pack and maintain two types of parachutes in common use, appropriate to the type ratings he seeks.

SEC. 65.121 TYPE RATINGS

(a) The following type ratings are issued under this subpart:
(1) Seat.
(2) Back.
(3) Chest.
(4) Lap.

(b) The holder of a senior parachute rigger certificate who qualifies for a master parachute rigger certificate is entitled to have placed on his master parachute rigger certificate the ratings that were on his senior parachute rigger certificate.

SEC. 65.123 ADDITIONAL TYPE RATINGS: REQUIREMENTS

A certificated parachute rigger who applies for an additional type rating must—

(a) Present evidence satisfactory to the Administrator that he has packed at least 20 parachutes of the type for which he seeks a rating, in accordance with the manufacturer's instructions and under the supervision of a certificated parachute rigger holding a rating for that type or a person holding an appropriate military rating; and

(b) Pass a practical test, to the satisfaction of the Administrator, showing his ability to pack and maintain the type of parachute for which he seeks a rating.

SEC. 65.125 CERTIFICATES: PRIVILEGES

(a) A certificated senior parachute rigger may—
(1) Pack or maintain (except for major repair) any type of parachute for which he is rated; and
(2) Supervise other persons in packing any type of parachute for which that person is rated in accordance with Sec. 105.43(a) or Sec. 105.45(b)(1) of this chapter.

(b) A certificated master parachute rigger may—
(1) Pack, maintain, or alter any type of parachute for which he is rated; and
(2) Supervise other persons in packing, maintaining, or altering any type of parachute for which the certificated parachute rigger is rated in accordance with Sec. 105.43(a) or Sec. 105.45(b)(1) of this chapter.

(c) A certificated parachute rigger need not comply with Secs. 65.127 through 65.133 (relating to facilities, equipment, performance standards, records, recent experience, and seal) in packing, maintaining, or altering (if authorized) the main parachute of a dual parachute pack to be used for intentional jumping.

SEC. 65.127 FACILITIES AND EQUIPMENT

No certificated parachute rigger may exercise the privileges of his certificate unless he has at least the following facilities and equipment available to him:

(a) A smooth top table at least three feet wide by 40 feet long.
(b) Suitable housing that is adequately heated, lighted, and ventilated for drying and airing parachutes.
(c) Enough packing tools and other equipment to pack and maintain the types of parachutes that he services.
(d) Adequate housing facilities to perform his duties and to protect his tools and equipment.

SEC. 65.129 PERFORMANCE STANDARDS

No certificated parachute rigger may—

(a) Pack, maintain, or alter any parachute unless he is rated for that type;
(b) Pack a parachute that is not safe for emergency use;
(c) Pack a parachute that has not been thoroughly dried and aired;
(d) Alter a parachute in a manner that is not specifically authorized by the Administrator or the manufacturer; or
(e) Pack, maintain, or alter a parachute in any manner that deviates from procedures approved by the Administrator or the manufacturer of the parachute; or
(f) Exercise the privileges of his certificate and type rating unless he understands the current manufacturer's instructions for the operation involved and has—
(1) Performed duties under his certificate for at least 90 days within the preceding 12 months; or
(2) Shown the Administrator that he is able to perform those duties.
SEC. 65.131 RECORDS

(a) Each certificated parachute rigger shall keep a record of the packing, maintenance, and alteration of parachutes performed or supervised by him. He shall keep in that record, with respect to each parachute worked on, a statement of—
(1) Its type and make;
(2) Its serial number;
(3) The name and address of its owner;
(4) The kind and extent of the work performed;
(5) The date when and place where the work was performed; and
(6) The results of any drop tests made with it.
(b) Each person who makes a record under paragraph (a) of this section shall keep it for at least 2 years after the date it is made.
(c) Each certificated parachute rigger who packs a parachute shall write, on the parachute packing record attached to the parachute, the date and place of the packing and a notation of any defects he finds on inspection. He shall sign that record with his name and the number of his certificate.

SEC. 65.133 SEAL

Each certificated parachute rigger must have a seal with an identifying mark prescribed by the Administrator, and a seal press. After packing a parachute he shall seal the pack with his seal in accordance with the manufacturer's recommendation for that type of parachute.

Part 91—General
Operating and Flight Rules

SUBPART A—GENERAL

SEC. 91.1 APPLICABILITY

Source: Docket No. 18334, 54 FR 34292, Aug. 18, 1989, unless otherwise noted.

(a) Except as provided in paragraphs (b) and (c) of this section and Secs. 91.701 and 91.703, this part prescribes rules governing the operation of aircraft (other than moored balloons, kites, unmanned rockets, and unmanned free balloons, which are governed by part 101 of this chapter, and ultralight vehicles operated in accordance with part 103 of this chapter) within the United States, including the waters within 3 nautical miles of the U.S. coast.
(b) Each person operating an aircraft in the airspace overlying the waters between 3 and 12 nautical miles from the coast of the United States shall comply with Secs. 91.1 through 91.21; Secs. 91.101 through 91.143; Secs. 91.151 through 91.159; Secs. 91.167 through 91.193; Sec. 91.203; Sec. 91.205; Secs. 91.209 through 91.217; Sec. 91.221; Secs. 91.303 through 91.319; Sec. 91.323; Sec. 91.605; Sec. 91.609; Secs. 91.703 through 91.715; and 91.903.
(c) This part applies to each person on board an aircraft being operated

SEC. 91.3 RESPONSIBILITY AND AUTHORITY OF THE PILOT IN COMMAND

(a) The pilot in command of an aircraft is directly responsible for, and is the final authority as to, the operation of that aircraft.
(b) In an in-flight emergency requiring immediate action, the pilot in command may deviate from any rule of this part to the extent required to meet that emergency.
(c) Each pilot in command who deviates from a rule under paragraph (b) of this section shall, upon the request of the Administrator, send a written report of that deviation to the Administrator.

SEC. 91.5 PILOT IN COMMAND OF AIRCRAFT REQUIRING MORE THAN ONE REQUIRED PILOT

No person may operate an aircraft that is type certificated for more than one required pilot flight crewmember unless the pilot in command meets the requirements of Sec. 61.58 of this chapter.

SEC. 91.7 CIVIL AIRCRAFT AIRWORTHINESS

(a) No person may operate a civil aircraft unless it is in an airworthy condition.
SEC. 91.17  ALCOHOL OR DRUGS

(b) The pilot in command of a civil aircraft is responsible for determining whether that aircraft is in condition for safe flight. The pilot in command shall discontinue the flight when unairworthy mechanical, electrical, or structural conditions occur.

SEC. 91.11  PROHIBITION ON INTERFERENCE WITH CREWMEMBERS

No person may assault, threaten, intimidate, or interfere with a crewmember in the performance of the crewmember’s duties aboard an aircraft being operated.

SEC. 91.13  CARELESS OR RECKLESS OPERATION

(a) Aircraft operations for the purpose of air navigation. No person may operate an aircraft in a careless or reckless manner so as to endanger the life or property of another.

(b) Aircraft operations other than for the purpose of air navigation. No person may operate an aircraft, other than for the purpose of air navigation, on any part of the surface of an airport used by aircraft for air commerce (including areas used by those aircraft for receiving or discharging persons or cargo), in a careless or reckless manner so as to endanger the life or property of another.

SEC. 91.15  DROPPING OBJECTS

No pilot in command of a civil aircraft may allow any object to be dropped from that aircraft in flight that creates a hazard to persons or property. However, this section does not prohibit the dropping of any object if reasonable precautions are taken to avoid injury or damage to persons or property.

SEC. 91.17  ALCOHOL OR DRUGS

(a) No person may act or attempt to act as a crewmember of a civil aircraft—

(1) Within 8 hours after the consumption of any alcoholic beverage;

(2) While under the influence of alcohol;

(3) While using any drug that affects the person’s faculties in any way contrary to safety; or

(4) While having .04 percent by weight or more alcohol in the blood.

(b) Except in an emergency, no pilot of a civil aircraft may allow a person who appears to be intoxicated or who demonstrates by manner or physical indications that the individual is under the influence of drugs (except a medical patient under proper care) to be carried in that aircraft.

(c) A crewmember shall do the following:

(1) On request of a law enforcement officer, submit to a test to indicate the percentage by weight of alcohol in the blood, when—

(i) The law enforcement officer is authorized under State or local law to conduct the test or to have the test conducted; and

(ii) The law enforcement officer is requesting submission to the test to investigate a suspected violation of State or local law governing the same or substantially similar conduct prohibited by paragraph (a)(1), (a)(2), or (a)(4) of this section.

(2) Whenever the Administrator has a reasonable basis to believe that a person may have violated paragraph (a)(1), (a)(2), or (a)(4) of this section, that person shall, upon request by the Administrator, furnish the Administrator, or authorize any clinic, hospital, doctor, or other person to release to the Administrator, the results of each test taken within 4 hours after acting or attempting to act as a crewmember that indicates percentage by weight of alcohol in the blood.

(d) Whenever the Administrator has a reasonable basis to believe that a person may have violated paragraph (a)(3) of this section, that person shall, upon request by the Administrator, furnish the Administrator, or authorize any clinic, hospital, doctor, or other person to release to the Administrator, the results of each test taken within 4 hours after acting or attempting to act as a crewmember that indicates the presence of any drugs in the body.

(e) Any test information obtained by the Administrator under paragraph (c) or (d) of this section may be evaluated in determining a person’s qualifications for any airman certificate or possible violations of this chapter and may be used as evidence in any legal proceeding under section 602, 609, or 901 of the Federal Aviation Act of 1958.

SEC. 91.19  CARRIAGE OF NARCOTIC DRUGS, MARIHUANA, AND DEPRESSANT OR STIMULANT DRUGS OR SUBSTANCES

(a) Except as provided in paragraph (b) of this section, no person may operate a civil aircraft within the United States with knowledge that narcotic drugs, marihuana, and depressant or stimulant drugs or substances as defined in Federal or State statutes are carried in the aircraft.

(b) Paragraph (a) of this section does not apply to any carriage of narcotic drugs, marihuana, and depressant or stimulant drugs or substances authorized by or under any Federal or State statute or by any Federal or State agency.

Subpart B—Flight Rules

SEC. 91.101  Applicability

Source: Docket No. 18334, 54 FR 34294, Aug. 18, 1989, unless otherwise noted.

General

This subpart prescribes flight rules governing the operation of aircraft within the United States and within 12 nautical miles from the coast of the United States.

SEC. 91.103  Preflight action

Each pilot in command shall, before beginning a flight, become familiar with all available information concerning that flight. This information must include—
SEC. 91.107  USE OF SAFETY BELTS, SHOULDER HARNESSSES, AND CHILD RESTRAINT SYSTEMS

(a) Unless otherwise authorized by the Administrator—
   (1) No pilot may take off a U.S.-registered civil aircraft (except a free balloon that incorporates a basket or gondola, or an airship type certificated before November 2, 1987) unless the pilot in command of that aircraft ensures that each person on board is briefed on how to fasten and unfasten that person's safety belt and, if installed, shoulder harness.
   (2) No pilot may cause to be moved on the surface, take off, or land a U.S.-registered civil aircraft (except a free balloon that incorporates a basket or gondola, or an airship type certificated before November 2, 1987) unless the pilot in command of that aircraft ensures that each person on board has been notified to fasten his or her safety belt and, if installed, his or her shoulder harness.
   (3) Except as provided in this paragraph, each person on board a U.S.-registered civil aircraft (except a free balloon that incorporates a basket or gondola or an airship type certificated before November 2, 1987) must occupy an approved seat or berth with a safety belt and, if installed, shoulder harness, properly secured about him or her during movement on the surface, takeoff, and landing. For seaplane and float equipped rotorcraft operations during movement on the surface, the person pushing off the seaplane or rotorcraft from the dock and the person mooring the seaplane or rotorcraft at the dock are excepted from the preceding seating and safety belt requirements. Notwithstanding the preceding requirements of this paragraph, a person may:
      (i) Be held by an adult who is occupying an approved seat or berth, provided that the person being held has not reached his or her second birthday and does not occupy or use any restraining device;
      (ii) Use the floor of the aircraft as a seat, provided that the person is on board for the purpose of engaging in sport parachuting;

SEC. 91.111  OPERATING NEAR OTHER AIRCRAFT

(a) No person may operate an aircraft so close to another aircraft as to create a collision hazard.
(b) No person may operate an aircraft in formation flight except by arrangement with the pilot in command of each aircraft in the formation.
(c) No person may operate an aircraft, carrying passengers for hire, in formation flight.

SEC. 91.113  RIGHT-OF-WAY RULES:
EXCEPT WATER OPERATIONS

(a) Inapplicability. This section does not apply to the operation of an aircraft on water.
(b) General. When weather conditions permit, regardless of whether an operation is conducted under instrument flight rules or visual flight rules, vigilance shall be maintained by each person operating an aircraft so as to see and avoid other aircraft. When a rule of this section gives another aircraft the right-of-way, the pilot shall give way to that aircraft and may not pass over, under, or ahead of it unless well clear.
(c) In distress. An aircraft in distress has the right-of-way over all other air traffic.
(d) Converging. When aircraft of the same category are converging at approximately the same altitude (except head-on, or nearly so), the aircraft to the other's right has the right-of-way. If the aircraft are of different categories—
   (1) A balloon has the right-of-way over any other category of aircraft;
   (2) A glider has the right-of-way over an airship, airplane, or rotorcraft; and
   (3) An airship has the right-of-way over an airplane or rotorcraft. However, an aircraft towing or refueling other aircraft has the right-of-way over all other engine-driven aircraft.
(e) Approaching head-on. When aircraft are approaching each other head-on, or nearly so, each pilot of each aircraft shall alter course to the right.
(f) Overtaking. Each aircraft that is being overtaken has the right-of-way and each pilot of an overtaking aircraft shall alter course to the right to pass well clear.
(g) Landing. Aircraft, while on final approach to land or while landing, have the right-of-way over other aircraft in flight or operating on the surface, except that they shall not take advantage of this rule to force an aircraft off the runway surface which has already landed and is attempting to make way for an aircraft on final approach. When two or more aircraft are approaching an airport for the purpose of landing, the aircraft at the lower altitude has the right-of-way, but it shall not take advantage of this rule to cut in front of another which is on final approach to land or to overtake that aircraft.

SEC. 91.119  MINIMUM SAFE ALTITUDES: GENERAL

Except when necessary for takeoff or landing, no person may operate an aircraft below the following altitudes:
(a) General. Unless otherwise authorized or required, each person operating an aircraft on or in the vicinity of an airport in a Class G airspace area must comply with the requirements of this section.

(b) Direction of turns. When approaching to land at an airport without an operating control tower in Class G airspace—

1. Each pilot of an airplane must make all turns of that airplane to the left unless the airport displays approved light signals or visual markings indicating that turns should be made to the right, in which case the pilot must make all turns to the right; and

2. Each pilot of a helicopter must avoid the flow of fixed-wing aircraft.

(c) Flap settings. Except when necessary for training or certification, the pilot in command of a civil turbojet-powered aircraft must use, as a final flap setting, the minimum certificated landing flap setting set forth in the approved performance information in the Airplane Flight Manual for the applicable conditions. However, each pilot in command has the final authority and responsibility for the safe operation of the pilot’s airplane, and may use a different flap setting for that airplane if the pilot determines that it is necessary in the interest of safety.

(d) Communications with control towers. Unless otherwise authorized or required by ATC, no person may operate an aircraft to, from, through, or on an airport having an operational control tower unless two-way radio communications are maintained between that aircraft and the control tower. Communications must be established prior to 4 nautical miles from the airport, up to and including 2,500 feet AGL. However, if the aircraft radio fails in flight, the pilot in command may operate that aircraft and land if weather conditions are at or above basic VFR weather minimums, visual contact with the tower is maintained, and a clearance to land is received. If the aircraft radio fails while in flight under IFR, the pilot must comply with Sec. 91.185.

SEC. 91.127 OPERATING ON OR IN THE VICINITY OF AN AIRPORT IN CLASS E AIRSPACE

(a) Unless otherwise required by part 93 of this chapter or unless otherwise authorized or required by the ATC facility having jurisdiction over the Class E airspace area, each person operating an aircraft on or in the vicinity of an airport in a Class E airspace area must comply with the requirements of Sec. 91.126.

(b) Departures. Each pilot of an aircraft must comply with any traffic patterns established for that airport in part 93 of this chapter.

(c) Communications with control towers. Unless otherwise authorized or required by ATC, no person may operate an aircraft to, from, through, or on an airport having an operational control tower unless two-way radio communications are maintained between that aircraft and the control tower. Communications must be established prior to 4 nautical miles from the airport, up to and including 2,500 feet AGL. However, if the aircraft radio fails in flight, the pilot in command may operate that aircraft and land if weather conditions are at or above basic VFR weather minimums, visual contact with the tower is maintained, and a clearance to land is received. If the aircraft radio fails while in flight under IFR, the pilot must comply with Sec. 91.185.

SEC. 91.151 FUEL REQUIREMENTS FOR FLIGHT IN VFR CONDITIONS

(a) No person may begin a flight in an airplane under VFR conditions unless (considering wind and forecast weather conditions) there is enough fuel to fly to the first point of intended landing and, assuming normal cruising speed—

1. During the day, to fly after that for at least 30 minutes; or

2. At night, to fly after that for at least 45 minutes.

(b) No person may begin a flight in a rotorcraft under VFR conditions unless (considering wind and forecast weather conditions) there is enough fuel to fly to the first point of intended landing and, assuming normal cruising speed, to fly after that for at least 20 minutes.

SEC. 91.155 BASIC VFR WEATHER MINIMUMS

(a) Except as provided in paragraph (b) of this section and Sec. 91.157, no person may operate an aircraft under VFR when the flight visibility is less, or at a distance from clouds that is less, than that prescribed for the corresponding altitude and class of airspace in the following table: (next page)

CLASS G:
1,200 feet or less
(1) Helicopter. A helicopter may be operated clear of clouds if operated at a speed that allows the pilot adequate opportunity to see any air traffic or obstruction in time to avoid a collision.

(b) Class G Airspace. Notwithstanding the provisions of paragraph (a) of this section, the following operations may be conducted in Class G airspace below 1,200 feet above the surface:

(1) Helicopter. A helicopter may be operated clear of clouds if operated at a speed that allows the pilot adequate opportunity to see any air traffic or obstruction in time to avoid a collision.

(2) Airplane. When the visibility is less than 3 statute miles but not less than 1 statute mile during night hours, an airplane may be operated clear of clouds if operated in an airport traffic pattern within one-half mile of the runway.

(c) Except as provided in Sec. 91.157, no person may operate an aircraft beneath the ceiling under VFR within the lateral boundaries of controlled airspace designated to the surface for an airport when the ceiling is less than 1,000 feet.

(d) Except as provided in Sec. 91.157 of this part, no person may take off or land an aircraft, or enter the traffic pattern of an airport, under VFR, within the lateral boundaries of the surface areas of Class B, Class C, Class D, or Class E airspace designated for an airport—

(1) Unless ground visibility at that airport is at least 3 statute miles; or

(2) If ground visibility is not reported at that airport, unless flight visibility during landing or takeoff, or while operating in the traffic pattern is at least 3 statute miles.

(e) For the purpose of this section, an aircraft operating at the base altitude of a Class E airspace area is considered to be within the airspace directly below that area.

SUBPART C—EQUIPMENT, INSTRUMENT, AND CERTIFICATE REQUIREMENTS

SEC. 91.211 SUPPLEMENTAL OXYGEN

(a) General. No person may operate a civil aircraft of U.S. registry—

(1) At cabin pressure altitudes above 12,500 feet (MSL) up to and including 14,000 feet (MSL) unless the required minimum flight crew is provided with and uses supplemental oxygen for that part of the flight at those altitudes that is of more than 30 minutes duration;

(2) At cabin pressure altitudes above 14,000 feet (MSL) unless the required minimum flight crew is provided with and uses supplemental oxygen during the entire flight time at those altitudes; and

(3) At cabin pressure altitudes above 15,000 feet (MSL) unless each occupant of the aircraft is provided with supplemental oxygen.

SEC. 91.223 TERRAIN AWARENESS AND WARNING SYSTEM

(b) Airplanes manufactured on or before March 29, 2002. Except as provided in paragraph (d) of this section, no person may operate a turbine-powered U.S.-registered airplane configured with six or more passenger seats, excluding any pilot seat, after March 29, 2005, unless that airplane is equipped with an approved terrain awareness and warning system that as a minimum meets the requirements for Class B equipment in Technical Standard Order (TSO)-C151. (Approved by the Office of Management and Budget under control number 2120-0631) (c) Airplane Flight Manual. The Airplane Flight Manual shall contain appropriate procedures for—

(1) The use of the terrain awareness and warning system; and

(2) Proper flight crew reaction in response to the terrain awareness and warning system audio and visual warnings.

(d) Exceptions.
(a) No pilot of a civil aircraft may allow a parachute that is available for emergency use to be carried in that aircraft unless it is an approved type and—
(1) If a chair type (canopy in back), it has been packed by a certificated and appropriately rated parachute rigger within the preceding 120 days; or
(2) If any other type, it has been packed by a certificated and appropriately rated parachute rigger—
   (i) Within the preceding 120 days, if its canopy, shrouds, and harness are composed exclusively of nylon, rayon, or other similar synthetic fiber or materials that are substantially resistant to damage from mold, mildew, or other fungi and other rotting agents propagated in a moist environment; or
   (ii) Within the preceding 60 days, if any part of the parachute is composed of silk, pongee, or other natural fiber, or materials not specified in paragraph (a)(2)(i) of this section.

(b) Except in an emergency, no pilot in command may allow, and no person may conduct, a parachute operation from an aircraft within the United States except in accordance with part 105 of this chapter.

(c) Unless each occupant of the aircraft is wearing an approved parachute, no pilot of a civil aircraft carrying any person (other than a crewmember) may execute any intentional maneuver that exceeds—
(1) A bank of 60 degrees relative to the horizon; or
(2) A nose-up or nose-down attitude of 30 degrees relative to the horizon.

(d) Paragraph (c) of this section does not apply to—
(1) Flight tests for pilot certification or rating; or
(2) Spins and other flight maneuvers required by the regulations for any certificate or rating when given by—
   (i) A certificated flight instructor; or
   (ii) An airline transport pilot instructing in accordance with Sec. 61.67 of this chapter.

(e) For the purposes of this section, approved parachute means—
(1) A parachute manufactured under a type certificate or a technical standard order (C-23 series); or
(2) A personnel-carrying military parachute identified by an NAF, AAF, or AN drawing number, an AAF order number, or any other military designation or specification number.
dance with an inspection program selected under the provisions of paragraph (f) of this section, except that, the owner or operator of a turbine-powered rotorcraft may elect to use the inspection provisions of Sec. 91.409(a), (b), (c), or (d) in lieu of an inspection option of Sec. 91.409(f).

Part 105—Parachute Operations

DJT 105.1 Applicability.

105.3 Definitions.

105.5 General.

105.7 Use of alcohol and drugs.

105.9 Inspections.

SUBPART B—Operating Rules

105.13 Radio equipment and use requirements.

105.15 Information required and notice of cancellation or postponement of a parachute operation.

105.17 Flight visibility and clearance from cloud requirements.

105.19 Parachute operations between sunset and sunrise.

105.21 Parachute operations over or into a congested area or an open-air assembly of persons.

105.23 Parachute operations over or onto airports.

105.25 Parachute operations in designated airspace.

SUBPART C—Parachute Equipment and Packing

105.41 Applicability.

105.43 Use of single-harness, dual-parachute systems.

105.45 Use of tandem parachute systems.

105.47 Use of static lines.

105.49 Foreign parachutists and equipment.

Authority: 49 U.S.C. 106(g), 40113-40114, 44701-44702, 44721.

SUBPART A

SEC. 105.1 Applicability

(a) Except as provided in paragraphs (b) and (c) of this section, this part prescribes rules governing parachute operations conducted in the United States.

(b) This part does not apply to a parachute operation conducted—

(1) In response to an in-flight emergency, or

(2) To meet an emergency on the surface when it is conducted at the direction or with the approval of an agency of the United States, or of a State, Puerto Rico, the District of Columbia, or a possession of the United States, or an agency or political subdivision thereof.

(c) Sections 105.5, 105.9, 105.13, 105.15, 105.17, 105.19 through 105.23, 105.25(a)(1) and 105.27 of this part do not apply to a parachute operation conducted by a member of an Armed Force—

(1) Over or within a restricted area when that area is under the control of an Armed Force.

(2) During military operations in uncontrolled airspace.

SEC. 105.3 Definitions

For the purposes of this part—

APPROVED PARACHUTE means a parachute manufactured under a type certificate or a Technical Standard Order (C-23 series), or a personnel-carrying U.S. military parachute (other than a high altitude, high speed, or ejection type) identified by a Navy Air Facility, an Army Air Field, and Air Force-Navy drawing number, an Army Air Field order number, or any other military designation or specification number.

AUTOMATIC ACTIVATION DEVICE means a self-contained mechanical or electro-mechanical device that is attached to the interior of the reserve parachute container, which automatically initiates parachute deployment of the reserve parachute at a pre-set altitude, time, percentage of terminal velocity, or combination thereof.

DIRECT SUPERVISION means that a certificated rigger personally observes a non-certificated person packing a main parachute to the extent necessary to ensure that it is being done properly, and takes responsibility for that packing.

DROP ZONE means any pre-determined area upon which parachutists or objects land after making an intentional parachute jump or drop. The center-point target of a drop zone is expressed in nautical miles from the nearest VOR facility when 30 nautical miles or less; or from the nearest airport, town, or city depicted on the appropriate Coast and Geodetic Survey World Aeronautical Chart or Sectional Aeronautical Chart, when the nearest VOR facility is more than 30 nautical miles from the drop zone.
FOREIGN PARACHUTIST means a parachutist who is neither a U.S. citizen or a resident alien and is participating in parachute operations within the United States using parachute equipment not manufactured in the United States.

FREEFALL means the portion of a parachute jump or drop between aircraft exit and parachute deployment in which the parachute is activated manually by the parachutist at the parachutist's discretion or automatically, or, in the case of an object, is activated automatically.

MAIN PARACHUTE means a parachute worn as the primary parachute used or intended to be used in conjunction with a reserve parachute.

OBJECT means any item other than a person that descends to the surface from an aircraft in flight when a parachute is used or is intended to be used during all or part of the descent.

PARACHUTE DROP means the descent of an object to the surface from an aircraft in flight when a parachute is used or intended to be used during all or part of that descent.

PARACHUTE JUMP means a parachute operation that involves the descent of one or more persons to the surface from an aircraft in flight when a parachute is used or intended to be used during all or part of that descent.

PARACHUTE OPERATION means the performance of all activity for the purpose of, or in support of, a parachute jump or a parachute drop.

This parachute operation can involve, but is not limited to, the following persons: parachutist, parachutist in command and passenger in tandem parachute operations, drop zone or owner or operator, jump master, certificated parachute rigger, or pilot.

PARACHUTIST means a person who intends to exit an aircraft while in flight using a single-harness, dual parachute system to descend to the surface.

PARACHUTIST IN COMMAND means the person responsible for the operation and safety of a tandem parachute operation.

PASSENGER PARACHUTIST means a person who boards an aircraft, acting as other than the parachutist in command of a tandem parachute operation, with the intent of exiting [sic] the aircraft while in flight using the forward harness of a dual harness tandem parachute system to descend to the surface.

PILOT' CHUTE means a small parachute used to initiate and/or accelerate deployment of a main or reserve parachute.

RAM-AIR PARACHUTE means a parachute with a canopy consisting of an upper and lower surface that is inflated byram air entering through specially designed openings in the front of the canopy to form a gliding airfoil.

RESERVE PARACHUTE means an approved parachute worn for emergency use to be activated only upon failure of the main parachute or in any other emergency where use of the main parachute is impractical or use of the main parachute would increase risk.

SINGLE-HARNESS, DUAL PARACHUTE SYSTEM means the combination of a main parachute, approved reserve parachute, and approved single-person harness and dual-parachute container. This parachute system may have an operational automatic activation device installed.

TANDEM PARACHUTE OPERATION means a parachute operation in which more than one person simultaneously uses the same tandem parachute system while descending to the surface from an aircraft in flight.

TANDEM PARACHUTE SYSTEM means the combination of a main parachute, approved reserve parachute, and approved harness and dual parachute container, and a separate approved forward harness for a passenger parachutist. This parachute system must have an operational automatic activation device installed.

SEC. 105.5 GENERAL

No person may conduct a parachute operation, and no pilot in command of an aircraft may allow a parachute operation to be conducted from an aircraft, if that operation creates a hazard to air traffic or to persons or property on the surface.

SEC. 105.7 USE OF ALCOHOL AND DRUGS

No person may conduct a parachute operation, and no pilot in command of an aircraft may allow a person to conduct a parachute operation from that aircraft, if that person is or appears to be under the influence of—

(a) Alcohol, or
(b) Any drug that affects that person's faculties in any way contrary to safety.

SEC. 105.9 INSPECTIONS

The Administrator may inspect any parachute operation to which this part applies (including inspections at the site where the parachute operation is being conducted) to determine compliance with the regulations of this part.

SUBPART B—OPERATING RULES

SEC. 105.13 RADIO EQUIPMENT AND USE REQUIREMENTS

(a) Except when otherwise authorized by air traffic control-

(1) No person may conduct a parachute operation, and no pilot in command of an aircraft may allow a parachute operation to be conducted from that aircraft, in or into controlled airspace unless, during that flight—

(i) The aircraft is equipped with a functioning two-way radio communication system appropriate to the air traffic control facilities being used; and

(ii) Radio communications have been established...
between the aircraft and the air traffic control facility having jurisdiction over the affected airspace of the first intended exit altitude at least 5 minutes before the parachute operation begins. The pilot in command must establish radio communications to receive information regarding air traffic activity in the vicinity of the parachute operation.

(2) The pilot in command of an aircraft used for any parachute operation in or into controlled airspace must, during each flight—
   (i) Continuously monitor the appropriate frequency of the aircraft’s radio communications system from the time radio communications are first established between the aircraft and air traffic control, until the pilot advises air traffic control that the parachute operation has ended for that flight.
   (ii) Advise air traffic control when the last parachutist or object leaves the aircraft.

(b) Parachute operations must be aborted if, prior to receipt of a required air traffic control authorization, or during any parachute operation in or into controlled airspace, the required radio communications system is or becomes inoperative.

SEC. 105.15 INFORMATION REQUIRED AND NOTICE OF CANCELLATION OR POSTPONEMENT OF A PARACHUTE OPERATION

(a) Each person requesting an authorization under Secs. 105.21(b) and 105.25(a)(2) of this part and each person submitting a notification under Sec. 105.25(a)(3) of this part must provide the following information (on an individual or group basis):
   (1) The date and time the parachute operation will begin.
   (2) The radius of the drop zone around the target expressed in nautical miles.
   (3) The location of the center of the drop zone in relation to—
      (i) The nearest VOR facility in terms of the VOR radial on which it is located and its distance in nautical miles from the VOR facility when that facility is 30 nautical miles or less from the drop zone target; or
      (ii) the nearest airport, town, or city depicted on the appropriate Coast and Geodetic Survey World Aeronautical Chart or Sectional Aeronautical Chart, when the nearest VOR facility is more than 30 nautical miles from the drop zone target.
   (4) Each altitude above mean sea level at which the aircraft will be operated when parachutists or objects exit the aircraft.
   (5) The duration of the intended parachute operation.
   (6) The name, address, and telephone number of the person who requests the authorization or gives notice of the parachute operation.
   (7) The registration number of the aircraft to be used.
   (8) The name of the air traffic control facility with jurisdiction of the airspace at the first intended exit altitude to be used for the parachute operation.

(b) Each holder of a certificate of authorization issued under Secs. 105.21(b) and 105.25(b) of this part must present that certificate for inspection upon the request of the Administrator or any Federal, State, or local official.

(c) Each person requesting an authorization under Secs. 105.21(b) and 105.25(a)(2) of this part and each person submitting a notice under Sec. 105.25(a)(3) of this part must promptly notify the air traffic control facility having jurisdiction over the affected airspace if the proposed or scheduled parachute operation is canceled or postponed.

SEC. 105.17 FLIGHT VISIBILITY AND CLEARANCE FROM CLOUD REQUIREMENTS

No person may conduct a parachute operation, and no pilot in command of an aircraft may allow a parachute operation to be conducted from that aircraft—

(a) Into or through a cloud, or
(b) When the flight visibility or the distance from any cloud is less than that prescribed in the following table:

<table>
<thead>
<tr>
<th>Altitude</th>
<th>Flight Visibility (Statute Miles)</th>
<th>Distance from Clouds</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) 1,200 feet or less above the surface regardless of the MSL altitude</td>
<td>5</td>
<td>1,000 feet above 1 mile horizontal</td>
</tr>
<tr>
<td>1,000 feet above 2,000 feet horizontal</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(2) More than 1,200 feet above the surface but less than 10,000 feet MSL</td>
<td>3</td>
<td>500 feet below 1,000 feet above 2,000 feet horizontal</td>
</tr>
<tr>
<td>(3) More than 10,000 feet MSL</td>
<td>5</td>
<td>1,000 feet below 1,000 feet above 1 mile horizontal</td>
</tr>
</tbody>
</table>
SEC. 105.19 PARACHUTE OPERATIONS BETWEEN SUNSET AND SUNRISE

(a) No person may conduct a parachute operation, and no pilot in command of an aircraft may allow a person to conduct a parachute operation from an aircraft between sunset and sunrise, unless the person or object descending from the aircraft displays a light that is visible for at least 3 statute miles.

(b) The light required by paragraph (a) of this section must be displayed from the time that the person or object is under a properly functioning open parachute until that person or object reaches the surface.

SEC. 105.21 PARACHUTE OPERATIONS OVER OR INTO A CONGESTED AREA OR AN OPEN-AIR ASSEMBLY OF PERSONS

(a) No person may conduct a parachute operation, and no pilot in command of an aircraft may allow a person to conduct a parachute operation from that aircraft, over or into a congested area of a city, town, or settlement, or an open-air assembly of persons unless a certificate of authorization for that parachute operation has been issued under this section. However, a parachutist may drift over a congested area or an open-air assembly of persons with a fully deployed and properly functioning parachute if that parachutist is at a sufficient altitude to avoid creating a hazard to persons or property on the surface.

(b) An application for a certificate of authorization issued under this section must—

(1) Be made in the form and manner prescribed by the Administrator, and

(2) Contain the information required in Sec. 105.15(a) of this part.

(c) Each holder of, and each person named as a participant in a certificate of authorization issued under this section must comply with all requirements contained in the certificate of authorization.

(d) Each holder of a certificate of authorization issued under this section must present that certificate for inspection upon the request of the Administrator, or any Federal, State, or local official.

SEC. 105.23 PARACHUTE OPERATIONS OVER OR ONTO AIRPORTS

No person may conduct a parachute operation, and no pilot in command of an aircraft may allow a parachute operation to be conducted from that aircraft, over or onto any airport unless—

(a) For airports with an operating control tower:

(1) Prior approval has been obtained from the management of the airport to conduct parachute operations over or on that airport.

(2) Approval has been obtained from the control tower to conduct parachute operations over or onto that airport.

(3) Two-way radio communications are maintained between the pilot of the aircraft involved in the parachute operation and the control tower of the airport over or onto which the parachute operation is being conducted.

(b) For airports without an operating control tower, prior approval has been obtained from the management of the airport to conduct parachute operations over or on that airport.

(c) A parachutist may drift over that airport with a fully deployed and properly functioning parachute if the parachutist is at least 2,000 feet above that airport's traffic pattern, and avoids creating a hazard to air traffic or to persons and property on the ground.

SEC. 105.25 PARACHUTE OPERATIONS IN DESIGNATED AIRSPACE

(a) No person may conduct a parachute operation, and no pilot in command of an aircraft may allow a parachute operation to be conducted from that aircraft—

(1) Over or within a restricted area or prohibited area unless the controlling agency of the area concerned has authorized that parachute operation;

(2) Within or into a Class A, B, C, D airspace area without, or in violation of the requirements of, an air traffic control authorization issued under this section;

(3) Except as provided in paragraph (c) and (d) of this section, within or into Class E or G airspace area unless the air traffic control facility having jurisdiction over the airspace at the first intended exit altitude is notified of the parachute operation no earlier than 24 hours before or no later than 1 hour before the parachute operation begins.

(b) Each request for a parachute operation authorization or notification required under this section must be submitted to the air traffic control facility having jurisdiction over the airspace at the first intended exit altitude and must include the information prescribed by Sec. 105.15(a) of this part.

(c) For the purposes of paragraph (a)(3) of this section, air traffic control facilities may accept a written notification from an organization that conducts parachute operations and lists the scheduled series of parachute operations to be conducted over a stated period of time not longer than 12 calendar months. The notification must contain the information prescribed by Sec. 105.15(a) of this part, identify the responsible persons associated with that parachute operation, and be submitted at least 15 days, but not more than 30 days, before the parachute operation begins. The FAA may revoke the acceptance of the notification for any failure of the organization conducting the parachute operations to comply with its requirements.

(d) Paragraph (a)(3) of this section does not apply to a parachute operation conducted by a member of an Armed Force within a restricted area that extends upward from the surface when that area is under the control of an Armed Force.
SUBPART C—PARACHUTE EQUIPMENT AND PACKING

SEC. 105.41 APPLICABILITY

This subpart prescribed rules governing parachute equipment used in civil parachute operations.

SEC. 105.43 USE OF SINGLE-HARNESS, DUAL-PARACHUTE SYSTEMS

No person may conduct a parachute operation using a single-harness, dual-parachute system, and no pilot in command of an aircraft may allow any person to conduct a parachute operation from that aircraft using a single-harness, dual-parachute system, unless that system has at least one main parachute, one approved reserve parachute, and one approved single person harness and container that are packed as follows:

(a) The main parachute must have been packed within 120 days before the date of its use of a certificated parachute rigger, the person making the next jump with that parachute, or a non-certificated person under the direct supervision of a certificated parachute rigger.

(b) The reserve parachute must have been packed by a certificated parachute rigger—
   (1) Within 120 days before the date of its use, if its canopy, shroud, and harness are composed exclusively of nylon, rayon, or similar synthetic fiber or material that is substantially resistant to damage from mold, mildew, and other fungi, and other rotting agents propagated in a moist environment; or
   (2) Within 60 days before the date of its use, if it is composed of any amount of silk, pongee, or other natural fiber, or material not specified in paragraph (b)(1) of this section.

(c) If installed, the automatic activation device must be maintained in accordance with manufacturer instructions for that automatic activation device.

SEC. 105.45 USE OF TANDEM PARACHUTE SYSTEMS

(a) No person may conduct a parachute operation using a tandem parachute system, and no pilot in command of an aircraft may allow any person to conduct a parachute operation from that aircraft using a tandem parachute system, unless—
   (1) One of the parachutists using the tandem parachute system is the parachutist in command, and meets the following requirements:
      (i) Has a minimum of 3 years of experience in parachuting, and must provide documentation that the parachutist—
      (ii) Has completed a minimum of 500 freefall parachute jumps using a ram-air parachute, and
      (iii) Holds a master parachute license issued by an organization recognized by the FAA, and
   (2) The person acting as parachutist in command:
      (i) Has briefed the passenger parachutist before boarding the aircraft. The briefing must include the procedures to be used in case of an emergency with the aircraft or after exiting the aircraft, while preparing to exit and exiting the aircraft, freefall, operating the parachute after freefall, landing approach, and landing.
      (ii) Uses the harness position prescribed by the manufacturer of the tandem parachute equipment.

(b) No person may make a parachute jump with a tandem parachute system unless—
   (1) The main parachute has been packed by a certificated parachute rigger, the parachutist in command making the next jump with that parachute, or a person under the direct supervision of a certificated parachute rigger.
   (2) The reserve parachute has been packed by a certificated parachute rigger in accordance with Sec. 105.43(b) of this part.
   (3) The tandem parachute system contains an operational automatic activation device for the reserve parachute, approved by the manufacturer of that tandem parachute system. The device must—
      (i) Have been maintained in accordance with manufacturer instructions, and
      (ii) Be armed during each tandem parachute operation.
   (4) The passenger parachutist is provided with a manual main parachute activation device and instructed on the use of that device, if required by the owner/operator.
   (5) The main parachute is equipped with a single-point release system.

SEC. 105.47 USE OF STATIC LINES

(a) Except as provided in paragraph (c) of this section, no person may conduct a parachute operation using a static line attached to the aircraft and the main parachute unless an assist device, described and attached as follows, is used to aid the pilot chute in performing its function, or, if no pilot chute is used, to aid in the direct deployment of the main parachute canopy. The assist device must—

(iv) Has successfully completed a tandem instructor course given by the manufacturer of the tandem parachute system used in the parachute operation or a course acceptable to the Administrator.

(v) Has been certified by the appropriate parachute manufacturer or tandem course provider as being properly trained on the use of the specific tandem parachute system to be used.

(2) The person acting as parachutist in command:
   (i) Has briefed the passenger parachutist before boarding the aircraft. The briefing must include the procedures to be used in case of an emergency with the aircraft or after exiting the aircraft, while preparing to exit and exiting the aircraft, freefall, operating the parachute after freefall, landing approach, and landing.
   (ii) Uses the harness position prescribed by the manufacturer of the tandem parachute equipment.
(1) Be long enough to allow the main parachute container to open before a load is placed on the device.

(2) Have a static load strength of—
   (i) At least 28 pounds but not more than 160 pounds if it is used to aid the pilot chute in performing its function; or
   (ii) At least 56 pounds but not more than 320 pounds if it is used to aid in the direct deployment of the main parachute canopy; and

(3) Be attached as follows:
   (i) At one end, to the static line above the static-line pins or, if static-line pins are not used, above the static-line ties to the parachute cone.
   (ii) At the other end, to the pilot chute apex, bridle cord, or bridle loop, or, if no pilot chute is used, to the main parachute canopy.

(b) No person may attach an assist device required by paragraph (a) of this section to any main parachute unless that person is a certificated parachute rigger or that person makes the next parachute jump with that parachute.

(c) An assist device is not required for parachute operations using direct-deployed, ram-air parachutes.

SEC. 105.49 FOREIGN PARACHUTISTS AND EQUIPMENT

(a) No person may conduct a parachute operation, and no pilot in command of an aircraft may allow a parachute operation to be conducted from that aircraft with an unapproved foreign parachute system unless—
   (1) The parachute system is worn by a foreign parachutist who is the owner of that system.
   (2) The parachute system is of a single-harness dual parachute type.
   (3) The parachute system meets the civil aviation authority requirements of the foreign parachutist’s country.
   (4) All foreign non-approved parachutes deployed by a foreign parachutist during a parachute operation conducted under this section shall be packed as follows—
      (i) The main parachute must be packed by the foreign parachutist making the next parachute jump with that parachute, a certificated parachute rigger, or any other person acceptable to the Administrator.
      (ii) The reserve parachute must be packed in accordance with the foreign parachutist’s civil aviation authority requirements, by a certificated parachute rigger, or any other person acceptable to the Administrator.

(b) No person may attach an assist device required by paragraph (a) of this section to any main parachute unless that person is a certificated parachute rigger or that person makes the next parachute jump with that parachute.

(c) An assist device is not required for parachute operations using direct-deployed, ram-air parachutes.

Part 119—Certification: Air Carriers and Commercial Operators

SEC. 119.1 APPLICABILITY

(a) This part applies to each person operating or intending to operate civil aircraft—
   (1) As an air carrier or commercial operator, or both, in air commerce; or
   (2) When common carriage is not involved, in operations of U.S.-registered civil airplanes with a seat configuration of 20 or more passengers, or a maximum payload capacity of 6,000 pounds or more.

(b) This part prescribes—
   (1) The types of air operator certificates issued by the Federal Aviation Administration, including air carrier certificates and operating certificates;
   (2) When common carriage is not involved, in operations of U.S.-registered civil airplanes with a seat configuration of 20 or more passengers, or a maximum payload capacity of 6,000 pounds or more, this part does not apply to—
      (6) Nonstop flights conducted within a 25-statute-mile radius of the airport of takeoff carrying persons or objects for the purpose of conducting intentional parachute operations.
1. Purpose

This advisory circular (AC) calls attention to regulatory requirements and recommended procedures for aeronautical operations at airports without operating control towers. It recommends traffic patterns and operational procedures for aircraft, lighter than air, glider, parachute, rotorcraft, and ultralight vehicle operations where such use is not in conflict with existing procedures in effect at those airports.

2. Cancellation

AC 90-66, Recommended Standard Traffic Patterns for Airplane Operations at Uncontrolled Airports, dated February 27, 1975, is canceled.

3. Principal Changes

This AC has been updated to reflect current procedures at airports without operating control towers. Principal changes include: adding on “Other Traffic Pattern” section, amending appendix charts to remain consistent with the Airman’s Information Manual (AIM), expanding the “Related Reading Material” section from “airplane” to “aeronautical” operations, adding definition and references to Common Traffic Advisory Frequency (CTAF), acknowledging straight-in approaches are not prohibited but may be operationally advantageous, and adding a paragraph on wake turbulence.

4. Definitions

a. Airports Without Operating Control Towers. Airports without control towers or an airport with a control tower which is not operating. These airports are commonly referred to as nontowered, uncontrolled, or part time towered airports.

b. Common Traffic Advisory Frequency (CTAF). A frequency designed for the purpose of carrying out airport advisory practices while operating to or from an airport without an operating control tower. The CTAF may be a UNICOM, MULTICOM, flight service station, or tower frequency and is identified in appropriate aeronautical publications.

d. Aviation USA, Aircraft Owners and Pilots Association (AOPA).

e. State aviation publications.

f. Various pilot guides.

g. Pilot Operations at Nontowered Airports, AOPA Air Safety Foundation pamphlet.

h. Guidelines for the Operation of Ultralight Vehicles at Existing Airports, United States Ultralight Association.

i. Facts for Pilots, United States Parachute Association.

j. The latest addition of the following ACs also contain information applicable to operations at airports without operating control towers:

(1) AC 90-23, Aircraft Wake Turbulence.

(2) AC 90-42, Traffic Advisory Practices at Airports Without Operating Control Towers.

(3) AC 90-48, Pilot’s Role in Collision Avoidance.

(4) AC 91-32, Safety In and Around Helicopters.

(5) AC 103-6, Ultralight Vehicle Operations - Airports, Air Traffic Control, and Weather.

(6) AC 105-2, Sport Parachute Jumping.

6. Background and Scope

a. Regulatory provisions relating to traffic patterns are found in Parts 91, 93, and 97 of the Federal Aviation Regulations (FAR). The airport traffic patterns contained in Part 93 relate primarily to those airports where there is a need for unique traffic pattern procedures not provided for in Part 91. Part 97 addresses instrument approach procedures. At airports without operating control towers, Part 91 requires only that pilots of airplanes approaching to land make all turns to the left unless light signals or visual markings indicate that turns should be made to the right.

b. The Federal Aviation Administration (FAA) believes that observance of a standard traffic pattern and the use of CTAF procedures as detailed in AC 90-42 will improve the safety and efficiency of aeronautical operations at airports without operating control towers.

7. General Operating Practices

a. Use of standard traffic patterns for all aircraft and CTAF procedures by radio equipped aircraft are recommended at all airports without operating control towers. However, it is recognized that other traffic patterns may already be in common use at some airports or that special circumstances or conditions exist that may prevent use of the standard traffic pattern.

b. The use of any traffic pattern procedure does not alter the responsibility of each pilot to see and avoid other aircraft. Pilots are encouraged to participate in “Operation Lights On,” which is a voluntary pilot safety program described in the AIM designed to enhance the “see and avoid” requirement.
c. As part of the preflight familiarization with all available information concerning a flight, each pilot should review all appropriate publications (AFD, AIM, Notices to Airmen (NOTAM), etc.), for pertinent information on current traffic patterns at the departure and arrival airports.

d. It is recommended that pilots utilize visual indicators, such as the segmented circle, wind direction indicator, landing direction indicator, and traffic pattern indicators which provide traffic pattern information.

e. The FAA encourages pilots to use the standard traffic pattern. However, for those pilots who choose to execute a straight-in approach, maneuvering for and execution of the approach should be completed so as not to disrupt the flow of arriving and departing traffic. Therefore, pilots operating in the traffic pattern should be alert at all times to aircraft executing straight-in approaches.

f. Pilots who wish to conduct instrument approaches should be particularly alert for other aircraft in the pattern so as to avoid interrupting the flow of traffic. Position reports on the CTA should include distance and direction from the airport, as well as the pilot’s intentions upon completion of the approach.

g. Pilots of inbound nonradio equipped aircraft should determine the runway in use prior to entering the traffic pattern by observing the landing direction indicator or by other means. Pilots should be aware that procedures at airports without operating control towers generally do not require the use of two-way radios; therefore, pilots should be especially vigilant for other aircraft while operating in the traffic pattern. h. Wake turbulence is generated by all aircraft. Therefore, pilots should expect to encounter turbulence while operating in a traffic pattern and in proximity to other aircraft. Aircraft components and equipment can be damaged by wake turbulence. In flight, avoid the area below and behind the aircraft generating turbulence especially at low altitude where even a momentary wake encounter can be hazardous. All operators should be aware of the potential adverse effects that their wake, rotor or propeller turbulence has on light aircraft and ultralight vehicles.

8. RECOMMENDED STANDARD TRAFFIC PATTERN

Airport owners and operators, in coordination with the FAA, are responsible for establishing traffic patterns. However, the FAA encourages airport owners and operators to establish traffic patterns as recommended in this AC. Further, left traffic patterns should be established except where obstacles, terrain, and noise sensitive areas dictate otherwise. Appendix 1 contains diagrams for recommended standard traffic patterns.

a. Prior to entering the traffic pattern at an airport without an operating control tower, aircraft should avoid the flow of traffic until established on the entry leg. For example, wind and landing direction indicators can be checked while at an altitude above the traffic pattern. When the proper traffic pattern direction has been determined, the pilot should then proceed to a point well clear of the pattern before descending to the pattern altitude.

b. Arriving aircraft should be at the appropriate traffic pattern altitude before entering the traffic pattern. Entry to the downwind leg should be at a 45 degree angle abeam the midpoint of the runway.

c. It is recommended that airplanes observe a 1,000 foot above ground level (AGL) traffic pattern altitude. Large and turbine powered airplanes should enter the traffic pattern at an altitude of 1,500 feet AGL or 500 feet above the established pattern altitude. A pilot may vary the size of the traffic pattern depending on the aircraft’s performance characteristics.

d. The traffic pattern altitude should be maintained until the aircraft is at least abeam the approach end of the landing runway on the downwind leg.

e. The base leg turn should commence when the aircraft is at a point approximately 45 degrees relative bearing from the runway threshold.

f. Landing and takeoff should be accomplished on the operating runway most nearly aligned into the wind. However, if a secondary runway is used, pilots using the secondary runway should avoid the flow of traffic to the runway most nearly aligned into the wind.

g. Airplanes on takeoff should continue straight ahead until beyond the departure end of the runway. Aircraft executing a go-around maneuver should continue straight ahead, beyond the departure end of the runway, with the pilot maintaining awareness of other traffic so as not to conflict with those established in the pattern. In cases where a go-around was caused by an aircraft on the runway, maneuvering parallel to the runway may be required to maintain visual contact with the conflicting aircraft.

h. Airplanes remaining in the traffic pattern should not commence a turn to the crosswind leg until beyond the departure end of the runway and within 300 feet below traffic pattern altitude, with the pilot ensuring that the turn to downwind leg will be made at the traffic pattern altitude.

i. When departing the traffic pattern, airplanes should continue straight out or exit with a 45-degree left turn (right turn for right traffic pattern) beyond the departure end of the runway after reaching pattern altitude. Pilots need to be aware of any traffic entering the traffic pattern prior to commencing a turn.

j. Airplanes should not be operated in the traffic pattern at an indicated airspeed of more than 200 knots (230 mph).

k. Throughout the traffic pattern, right of way rules apply as stated in FAR Part 91.113. Any aircraft in distress has the right of way over all other aircraft. In addition, when converging aircraft are of different categories, a balloon has the right of way over any other category of aircraft; a glider has the right of way over an airship, airplane, or rotorcraft; and an airship has the right of way over an airplane or rotorcraft.
9. OTHER TRAFFIC PATTERNS.

Airport operators routinely establish local procedures for the operation of gliders, parachutists, lighter than air aircraft, helicopters, and ultralight vehicles. Appendices 2 and 3 illustrate these operations as they relate to recommended standard traffic patterns.

a. Rotorcraft.
   (1) In the case of a helicopter approaching to land, the pilot must avoid the flow of fixed wing aircraft and land on a marked helipad or suitable clear area. Pilots should be aware that at some airports, the only suitable landing area is the runway.
   (2) All pilots should be aware that rotorcraft may fly slower and approach at steeper angles than airplanes. Air taxi is the preferred method for helicopter ground movements which enables the pilot to proceed at an optimum airspeed, minimize downwash effect, and conserve fuel. However, flight over aircraft, vehicles, and personnel should be avoided.
   (3) In the case of a gyrocopter approaching to land, the pilot should avoid the flow of fixed wing aircraft until turning final for the active runway.
   (4) A helicopter operating in the traffic pattern may fly a pattern similar to the airplane pattern at a lower altitude (500 AGL) and closer to the airport. This pattern may be on the opposite side of the runway with turns in the opposite direction if local policy permits.
   (5) Both classes of rotorcraft can be expected to practice power off landing (autorotation) which will involve a very steep angle of approach and high rate of descent (1,500 - 2,000 feet/minute).

b. Gliders.
   (1) A glider, including the tow aircraft during towing operations, has the right of way over powered aircraft.
   (2) If the same runway is used by both airplanes and gliders, the glider traffic pattern will be inside the pattern of engine driven aircraft. If a “Glider Operating Area” is established to one side of a powered aircraft runway, the glider pattern will normally be on the side of the airport closest to the “Glider Operating Area.” This will allow gliders to fly the same direction traffic pattern as powered aircraft in one wind condition and necessitate a separate opposing direction traffic pattern in the opposite wind condition. (See examples in Appendix 2, Glider Operations).
   (3) Typically, glider traffic patterns have entry points (initial points) from 600 to 1,000 feet AGL.

c. Ultralight Vehicles.
   (1) In accordance with FAR Part 103, ultralight vehicles are required to yield the right of way to all aircraft.
   (2) Ultralight vehicles should fly the rectangular pattern as described in Appendix 2. Pattern altitude should be 500 feet below and inside the standard pattern altitude established for the airport. An ultralight pattern with its own dedicated landing area will typically have a lower traffic pattern parallel to the standard pattern with turns in the opposite direction.
   (3) All pilots should be aware that ultralights will fly significantly slower than airplanes. In addition, ultralights may also exhibit very steep takeoff and approach angles. Turns may be executed near the end of the runway in order to clear the area expeditiously.

87. General provisions

a. Each FAA Form 7711-1, Certificate of Waiver or Authorization, shall include general and special provisions developed by the issuing FAA FSDO. Many safety provisions are general in nature and are applicable to all aviation events. The FAA FSDO will tailor the general and special provisions to accommodate the sponsor’s needs.

b. Provisions that appear on the waiver shall be restricted to protective measures, controls, or requirements that are not otherwise specified by the FAR.

c. Regulatory requirements (not waived) shall not be included as special provisions.

d. A sample of general provisions can be found in Appendix 2.

88. Special provisions

Special provisions are conditions, requirements, or limitations necessary to protect persons and property on the surface and other users of the national airspace system.

a. Ensuring Safety. The special provisions of FAA Form 7711-1 ensure that the aviation event can be conducted without an adverse effect on safety. Every airshow waiver shall contain special provisions to ensure adequate public and non-airshow traffic safety. There may be a wide variation in the type of special provisions called for.

b. Use of Special Provisions. Some events require extensive and highly detailed special provisions, whereas others can be fairly simple. In addition to variation among events, local conditions have much to do with what special provisions are necessary.

1. Special provisions shall pertain to protective measures and control requirements which are not specifically covered by the FAR.
2. It may be necessary to increase one regulatory minimum in order to authorize safe deviation from another.
3. In order to permit aerobatic flight in a control zone or near a busy airport, it might be necessary to increase the minimum visibility requirement to 5 miles.

c. Responsibility for compliance with the terms of the waiver issued for aerobatic practice areas rests with the pilot. In cases where the waiver is issued for members of an organization, a designated individual responsible for overseeing compliance with the terms of the waiver should be identified to the FAA.

d. A sample of special provisions can be found in Appendix 3.

AC No: 91-45C

AC No: 91-45C, Appendix 2:

General Provisions

a. The holder of the FAA Form 7711-1, Certificate of Waiver or Authorization, shall retain sole responsibility for safeguarding persons and property on the surface and shall inform the issuing FAA office in writing of the person named to ensure overall safety of the event.

b. The holder of the FAA Form 7711-1 shall ensure that participants are thoroughly briefed on special field rules, manner and order of events, and are available for briefing on the provisions of the waiver before beginning the activities. No person may participate in any event unless that person has received a briefing on the provisions of the waivers.

c. The holder shall notify the FAA Flight Service Station of the date, time, place, areas, altitudes, nature of the activity, and the duration of the operations and request that a Notice to Airmen (NOTAM) be issued. Such action shall be accomplished at least 48 hours before the event.

d. All civil aircraft and pilots participating in the demonstration shall be available for FAA inspection before the scheduled event.

e. For civilian aircraft, only required flight crewmembers (specified in aircraft operating limitations) or those persons actively participating in the demonstration (wingwalkers and stunt persons, etc.) will be carried on any aircraft engaged in demonstrations authorized by this waiver.

f. A control point shall be established from which the holder, or his or her representative, shall direct the demonstration and be continuously available to the FAA and the person designated as responsible for the overall safety of the event.

g. A showline (man-made or natural) clearly visible to the performers/pilots shall be provided to assist them in compliance with the approved distances from the spectator area.

h. Adequate communications capability (oral or visual) must be provided to advise spectators and participants that the aerial demonstration has been halted or cancelled, or to otherwise communicate to maintain a safe operation.

i. A physical barrier and adequate policing shall be provided to confine the spectators to designated areas. The number of personnel involved in crowd control will depend on the type of barrier. (More people will be required for a rope barrier than for a snow fence.)

q. The demonstration may be halted when unauthorized persons, vehicles, or aircraft enter the operations area, or for any other reason in the interest of safety. Only those persons necessary to support the operation should be authorized in the operating area. The holder of the FAA Form 7711-1 assumes responsibility for persons that enter the operations area.

r. The FAA has the authority to cancel or delete any or all acts or events if, in its opinion, the safety of persons or property on the ground or in the air is in jeopardy, or there is a contravention of the terms of the waiver.
s. Aircraft engines shall not be started and aircraft will not be taxied in designated spectator areas or static display areas unless adequate measures are taken to protect the spectators. Areas where engines, propellers, or rotors will be turning must be at least 100 feet from the spectator areas unless they are protected by a barrier that will prevent entry by unauthorized personnel.

t. Persons or aircraft not appearing on the FAA Form 7711-2, and approved on the FAA Form 7711-1, may not participate without specific approval by the FAA.

u. In the event of an accident considered to be the result of a course deficiency or racing procedure, flight operations will be cancelled until the deficiency has been corrected and accepted by the person designated responsible for the overall safety of the event.

AC No: 91-45C, Appendix 3: Special Provisions for Parachute Demonstration Jumps

a. For jumps into congested areas, two-way radio communication between the aircraft airlifting the parachutists and the landing area shall be continuously maintained for all jumps.

b. Provisions shall be made by the holder of FAA Form 7711-1 to keep spectators out of the landing area.

c. The parachute jump shall not be conducted when the ceiling is less than 2,500 feet and the visibility less than 5 miles.

d. Use the appropriate landing area provision based on the qualifications of the jumper. Landing areas will be divided into two distinct categories:

(1) Parachutists who hold a USPA Class C or D license, or are members of a DOD-sanctioned parachute demonstration team, must select a landing area that will permit the jumper to land not closer than 50 feet from any spectator and will not involve passing over persons on the surface at an altitude of less than 250 feet.

(2) Parachutists who hold a USPA Class D license with an exhibition rating, or are members of a DOD-sanctioned parachute demonstration team, who certify that they will use a steerable square main and reserve canopy, will be permitted to exit over or into a congested area. The selected landing area must not permit the jumper to land closer than 15 feet from any spectator and will not involve passing over persons on the surface at an altitude of less than 50 feet.

e. The holder of FAA Form 7711-1 shall brief the pilot in command of the aircraft and the jumpers on the terms of this authorization.

f. The FAA inspector may wish to develop a provision that directs the pilot in command or the holder of FAA Form 7711-1 to use a specific Air Traffic Control facility and frequency.

ADVISORY CIRCULAR 105-2C

Note: FAR 105 was revised in July 2001, with significant changes, particularly in the areas of jump notification and equipment. By this edition of the SIM, the FAA had not yet revised AC-105-2 to reflect these changes.

1. PURPOSE

This advisory circular (AC) provides suggestions to improve sport parachuting safety and disseminates information to assist all parties associated with sport parachuting in complying with Federal Aviation Regulations (FAR) Part 105, Parachute Jumping. It also contains a list of aircraft which may be operated with one cabin door removed and includes procedures for obtaining Federal Aviation Administration (FAA) authorization for flight with the door removed.

2. CANCELLATION

AC 105-2B, Sport Parachute Jumping, dated August 21, 1989, is cancelled.

Note: Distribution of this AC (105-2B) was not made.

3. BACKGROUND

A. Sport parachute jumping (also called skydiving) activity continues to increase and is an FAA-recognized aeronautical activity. Even though parachutists (also called skydivers) are not certificated airmen the FAA recommends that all beginning parachutists obtain formal training. Training should be conducted in accordance with the United States Parachute Association (USPA) training recommendations or by training programs from other similar organizations.

B. Skydiving has certain inherent risks especially for students. In response to this risk, the skydiving community has developed procedures and practices to reduce the risk factors. A significant level of safety can be maintained by following these procedures and by properly preparing for each parachute jump. Developments in parachuting continue to contribute to the advancement of aviation technology and aviation safety.

C. In the revision process of this AC, the FAA solicited comments from the parachute industry and users. The USPA should be contacted for state-of-the-art information which relates to parachute jumping that is not specifically mentioned in this AC (see paragraph 5c).

4. SAFETY SUGGESTIONS

A. Medical. All prospective skydivers are urged to receive a physical examination prior to their first jump. The physician should be informed of the purpose of the examination.

B. Initial Training. The FAA encourages beginning parachutists to seek instruction from a parachuting instructor recognized by the USPA. Initial training sets the foundation for the skydiver’s continued education and advancement.

C. Current sport parachute student training programs include the following programs, details of which can be obtained from the USPA (see paragraph 5c).
1. The static line progression method.
2. The accelerated free fall progression method.
3. Tandem jumping, which uses a dual harness and dual pack parachute system.

D. FAR, technical standard orders (TSO), and ACs on sport parachuting with which all skydivers and jump pilots should be familiar:
1. FAR Part 65—Certification: Airmen Other Than Flight Crewmembers.
2. FAR Part 91—General Operating and Flight Rules.
3. FAR Part 105—Parachute Jumping.
4. FAR Part 149—Parachute Lofts.
5. TSO-C23c, Personnel Parachute Assemblies.
7. AC 140-7 (latest edition), Federal Aviation Administration Certificated Maintenance Agencies Directory. Note: See paragraph 5 for more detailed information.

E. Safety Devices and Equipment.
1. Deployment Assist Device. FAR Section 105.43(b) requires all persons making a parachute jump with a static line attached to the aircraft and the main parachute to use an assist device to aid the pilot chute in performing its function or, if no pilot chute is used, to aid in the direct deployment of the main parachute canopy.
2. Automatic Activation Devices. A jumper may have a tendency to feel more at ease if equipped with an automatic activation device (AAD). However, experience shows that such devices may not be completely reliable and should be used only as a backup to proper training and procedures. Skydivers who use an AAD on their reserve/auxiliary parachute should ensure that the installation of such a device has been approved by the parachute manufacturer or the FAA (see paragraph 8). The FAA does not approve AAD’s. They do approve the installation which is submitted with the manufacturer’s TSO paperwork. The manufacturer’s instructions for installation should be followed. The installation of an AAD to a TSO or military specification (MIL-SPEC)-approved parachute constitutes a major alteration to that parachute. A jumper who uses any type of AAD should be aware of its level of reliability and become fully proficient with the device. A pre-jump check should be made for proper setting, arming, and operational reliability to ensure proper functioning of the AAD. When the situation requires use of the reserve parachute, the jumper should always manually pull the reserve/auxiliary ripcord even when using an AAD.
3. Water Safety Equipment. Some type of flotation gear should be worn whenever the intended exit point, or landing point of a skydiver is within 1 mile of an open body of water.
4. Oxygen Equipment. Jumpers should use supplemental breathing oxygen when the jump aircraft is at altitudes above 10,000 feet mean sea level (MSL) for more than 30 minutes. Oxygen must be used continuously at all times above 15,000 feet MSL. Above 25,000 MSL, pressure demand oxygen systems should be used. High altitude jumps should be made only after first becoming familiar with the problems and hazards created by low temperatures, lack of oxygen, and the various types of oxygen equipment. High altitude jumps should not be attempted under any circumstances without an adequate supply of breathing oxygen (welding and medical oxygen is unsafe and should not be used).

F. Weather. Strong or gusty winds can be dangerous especially to student jumpers. In addition, skydivers and pilots should ensure that there is adequate ceiling and visibility (see paragraph 14i).

G. Advanced Parachuting. Many of the safety suggestions presented in this AC are intended primarily for the student parachutist. All student jumps should be made in a controlled training environment. Individual experience and judgement dictate what additional training should be obtained before undertaking more advanced parachuting activities. Acquire proper experience and training before using unfamiliar or high-performance parachute equipment.

5. Information on Regulations and Associated Publications
A. FAR. This paragraph describes the FAR parts which are of interest to skydivers and jump aircraft pilots. They may be purchased from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402-9325. AC 00-44 (latest edition), Status of Federal Aviation Regulation, contains ordering instructions, prices, and stock numbers. This AC is based on FAR requirements in effect on the date of this AC. Since the FAR may be amended at any time, skydivers and pilots should keep up with changes in the FAR and always comply with current requirements.
1. FAR Part 65—Certification: Airmen Other Than Flight Crewmembers. Subpart F concerns parachute riggers, their eligibility requirements, privileges and performance standards.
2. FAR Part 91—General Operating and Flight Rules. FAR Section 91.307, Parachutes and Parachuting, prohibits a pilot of a civil aircraft from allowing an emergency parachute to be carried aboard that aircraft unless it is an approved type.
3. FAR Part 105—Parachute Jumping. This part is especially important to parachutists and to the pilots who fly them since it contains the rules on intentional parachute jumping.
B. TSO-C23c sets forth the minimum performance and safety requirements for parachutes. TSO-C23c may be obtained by writing to the FAA, Aircraft Certification
6. PARACHUTE RULES

FAR Section 1.1 defines a parachute as a device used or intended to be used to retard the fall of a body or object through the air. For the purposes of this AC, a parachute assembly normally, but not exclusively, consists of the following major components: a canopy, a deployment device, a pilot chute and/or drogue, risers, a stowage container, a harness(es), and an actuation device (ripcord). There are, of course, some lesser parts associated with these main components such as connector links, bridles, and hardware. The term pack (such as backpack or chestpack), when used in this AC, refers to the parachute assembly less the harness. In the case where the harness and parachute are TSO-approved as an intended component, the term pack refers to the complete parachute assembly, less the main canopy and risers. This distinction is essential for a clear understanding relating to the use, packing, repairing, and alteration of parachutes.

A. Parachute Equipment. FAR Section 105.43 requires a certificated and appropriately rated parachute rigger pack the reserve/auxiliary parachute. The main parachute may be packed by:

1. Any certificated parachute rigger; or
2. Anyone under the supervision of a certificated parachute rigger. However, only those who have been thoroughly checked out by a certificated parachute rigger or USPA-rated instructor should attempt to pack for themselves. The FAA requires each parachute to be packed as follows:

A. A certificated parachute rigger or the person making the jump must have packed the main parachute within 120 days before the date of its use.

B. A certificated and appropriately rated parachute rigger must have packed the auxiliary/reserve parachute:
   1. Within 120 days before the date of use, if its canopy, shroud, and harness are composed exclusively of nylon, rayon, or other similar synthetic fiber or material that is substantially resistant to damage from mold, mildew, or other rotting agents propagated in a moist environment; or
   2. Within 60 days before the date of use, if the assembly is composed in any amount of silk, pongee, or any other natural fiber or material not specified above.

7. PARACHUTE PACKING

FAR Section 105.43 requires that a certificated and appropriately rated parachute rigger pack the reserve/auxiliary parachute. The main parachute may be packed by:

1. Any certificated parachute rigger; or
2. Anyone under the supervision of a certificated parachute rigger. However, only those who have been thoroughly checked out by a certificated parachute rigger or USPA-rated instructor should attempt to pack for themselves. The FAA requires each parachute to be packed as follows:

A. A certificated parachute rigger or the person making the jump must have packed the main parachute within 120 days before the date of its use.

B. A certificated and appropriately rated parachute rigger must have packed the auxiliary/reserve parachute:
   1. Within 120 days before the date of use, if its canopy, shroud, and harness are composed exclusively of nylon, rayon, or other similar synthetic fiber or material that is substantially resistant to damage from mold, mildew, or other rotting agents propagated in a moist environment; or
   2. Within 60 days before the date of use, if the assembly is composed in any amount of silk, pongee, or any other natural fiber or material not specified above.

8. PARACHUTE ALTERATIONS

Parachute alterations are changes to the FAA-approved configuration. Examples include installation of reinforcement tape or fittings, alteration of the harness such as changing the size, removal of a manufacturer-installed part, or the installation of an AAD on an auxiliary/reserve parachute system in which the manufacturer does not authorize such installation.

A. An alteration to an approved parachute system used for intentional jumping must be done in accordance with approved manuals and specifications and only by those with specific authorization to perform that alteration. Specific approval is not needed for the method of altering a main parachute. A person seeking authorization to alter an approved parachute system should proceed as follows:
   1. A person qualified to alter a parachute (as listed below) should contact his/her local FAA Flight Standards District Office (FSDO) inspector to discuss the proposed alteration. The applicant should be prepared to show the inspector the nature of the alteration by using a sample assembly, sketch or drawing, and be prepared to discuss the nature of the tests that will be needed to show the altered parachute meets all applicable requirements.
   2. The inspector will review the proposal with the applicant, and a plan of action will be agreed upon.
3. The applicant will then prepare an application, in letter form, addressed to the local FSDo. All pertinent data should be attached. The data should include:
   a. A clear description of the alteration.
   b. Drawings, sketches, or photographs if necessary.
   c. Information such as thread size, stitch pattern, materials used, and location of altered components.
   d. Some means of identifying the altered parachute (model and serial number).
4. When satisfied, the inspector will indicate approval by date stamping, signing, and placing the FSDo identification stamp on the letter of application.
   a. Alterations to Approved Parachutes may be Performed Only By:
      1) A certificated and appropriately rated master parachute rigger.
      2) A certificated parachute loft with an appropriate rating.
      3) A parachute manufacturer.
      4) Any other manufacturer that the Administrator considers to be competent.

9. REMOVAL OF PILOT CHUTE

A certificated senior or master parachute rigger may remove the pilot chute from an auxiliary/reserve parachute. When this is done, the parachute must be plainly marked “PILOT CHUTE REMOVED. This parachute may be used for intentional jumping only.”

10. EXTRA EQUIPMENT

Attachment of an instrument panel, knife sheath, or other material to the exterior of the parachute assembly is not considered an alteration. If any extra equipment is attached to a harness, care should be taken not to impair the functional design of the system.

11. ASSEMBLY OF MAJOR PARACHUTE COMPONENTS

A. The assembly or mating of approved parachute components from different manufacturers may be made by a certificated appropriately rated parachute rigger or parachute loft in accordance with the parachute manufacturer's instructions and without further authorization by the manufacturer or the FAA. Specifically, when various parachute components are interchanged, the parachute rigger should follow the canopy manufacturer's instructions as well as the parachute container manufacturer's instructions. However, the container manufacturer's instructions take precedence when there is a conflict between the two.

B. Assembled Parachute Components Must be Compatible. Each component of the resulting assembly must function properly and may not interfere with the operation of the other components. For example:
   1. Do not install a high volume canopy into a low-volume parachute container since the proper functioning of the entire parachute assembly could be adversely affected.
   2. A TSO'ed canopy may be assembled with a demilitarized harness, or vice versa, as long as the assembled components comply with the safety standard of the original design.

C. Any questions about the operation of the assembly should be resolved by actual tests by the rigger or loft to make certain the parachute is safe for emergency use.

D. The parachute rigger or the parachute loft who are assembling components manufactured under TSO-C23c will record, in the space provided on the container, the data required by Aerospace Standard AS-8015B, paragraph 4.2.1. (Copies may be obtained from the Engineering Society for Advancing Mobility Land, Sea, Air and Space, 400 Commonwealth Drive, Warrendale, PA 15096-0001.)

E. The strength of the harness must always be equal to or greater than the maximum force generated by the canopy during certification tests.
   1. In a case where the harness is certificated under TSO-C23b and the canopy under TSO-C23c, the maximum generated force of the canopy must not exceed the certificated category force of the harness and container; i.e., Low-Speed Category (3,000 lbs.) and Standard Category (5,000 lbs.). In this instance, no additional marking on the container is necessary.
   2. In the case where the canopy is certificated under the TSO-C23b and the harness under TSO-C23c, the strength of the harness must be equal to or greater than the certificated category force of the canopy.

F. The user of a single harness, dual pack parachute system, which is a sport assembly consisting of a main and auxiliary/reserve parachute, may perform simple assembly and disassembly operations necessary for transportation, handling, or storage between periods of use if the parachute is designed to simplify such assembly and disassembly without the use of complex operations.

12. REPAIRS

Parachute repairs can be classed as major repairs or minor repairs. A major repair, as defined in FAR Section 1.1, is a repair “...that, if improperly done, might appreciably affect weight, balance, structural strength, performance, powerplant operation, flight characteristics, or other qualities affecting airworthiness.” (Balance and powerplant operation do not apply to parachutes.) A minor repair, as defined in FAR Section 1.1, “...means a repair other than a major repair.” Major repairs to parachutes may be made by a master parachute rigger, an appropriately rated parachute loft, or a manufacturer. Examples of major repairs are replacement of a canopy panel or suspension line, or sewing a large patch on a canopy. The
parachute manufacturer’s instructions should be followed when completing repairs to any portion of the parachute.

13. PLATING OF FITTINGS

Plating or replating of load-carrying parachute fittings may cause hydrogen embrittlement and subsequent failure under stress unless the plating is done properly. Chrome plated harness adjustment hardware may also have a smoother finish than the original and may permit slippage. The parachutist should be aware of these possible hazards.

14. PILOT RESPONSIBILITIES

The pilot in command of a jump aircraft is solely responsible for certain requirements and jointly responsible for others. The following is a partial list of these requirements:

A. Pilot Certification and Experience Requirements. The pilot in command is solely responsible for meeting the certification, proficiency, and experience requirements of FAR Part 61.

B. Operational Requirements. The pilot in command is solely responsible for the operational requirements of FAR Part 91 to include the special operating limitations and placards required for flight with the door open or removed.

C. Weight and Balance Procedures. The pilot in command is solely responsible to assure that his/her aircraft is properly loaded and operated so that it stays within gross weight and center of gravity (CG) limitations. Additional aircraft station position information (loading schedule) should be obtained by the pilot in command for future weight and balance computations. In addition, pilots are solely responsible for reviewing these records and/or the flight manual to become familiar with an aircraft's weight and balance procedures and flight characteristics.

D. When Computing Weight and Balance. The pilot in command must include the following factors. If this information is not obtained, the pilot would experience considerable difficulty in determining the actual loaded aircraft CG:

1. The maximum allowable gross weight and the CG limitations.
2. The weight of all standard equipment which has been removed (seats and door, etc.)
3. The new empty weight and CG location.
4. The weight and CG location when the aircraft is fully loaded.
5. The aircraft's weight and CG locations for variations in the number of parachutists and fuel carried on each flight.
6. The weight and location of jumpers during each phase of the flight in order to assure that the aircraft stays within CG limits. The pilot in command should keep in mind that the shifting weight distribution of skydivers as they gather at a cabin door in preparation for exit will require a determination of any adverse effects this will have on the aircraft's weight and balance, controllability, and stability.

E. Suitable placards should be located in the aircraft to help the pilot inform skydivers of the maximum approved loading and weight distribution. These placards should be located where they will be seen by anyone boarding the aircraft and clearly show the maximum approved seating capacity and the load distribution. However, since many parachutists are not familiar with aircraft weight and balance procedures, it becomes the pilot in command's responsibility to ensure that proper weight and balance is maintained throughout all parachute jump operations. Anyone desiring additional information concerning approval data for any specific aircraft should contact the local FSDO (see related information in paragraph 23.b).

F. Seatbelts and Approved Loading. FAR Section 91.14 permits persons aboard an aircraft for the purpose of participating in sport parachuting activities to use the floor of the aircraft for a seat. Seatbelts must be provided for each person and their installation must be approved. The approved number of persons which can be carried is found on the aircraft's type certificate data sheet, supplemental type certificate data sheet, Form 337 (field approval), or in the FAA-approved flight manual.

G. Parachute Landing Zone. It is good practice for the pilot to ensure that the parachute landing zone is plainly visible from the aircraft before releasing parachutists.

H. Altitude Reporting. Report all altitudes to air traffic control (ATC) in feet above MSL.

I. Flight Visibility and Clearance from Clouds. The pilot and jumper are jointly responsible for complying with the flight visibility and cloud clearance requirements of FAR Section 105.29. Aircraft flight under visual flight rules (VFR) conditions and persons making parachute jumps require minimum clearance from clouds and minimum visibility depending upon the altitude at which the activity is taking place.

1. For activities which are at or above 10,000 feet MSL, the required minimum distance from clouds is 1,000 feet under, 1,000 feet over, and 1 mile horizontally from clouds. Flight visibility must be at least 5 miles.

2. For activities which are at more than 1,200 feet above the surface but less than 10,000 feet MSL, the required minimum distance from clouds is 500 feet under, 1,000 feet over, and 2,000 feet horizontally from clouds. Flight visibility must be at least 3 miles.

   Note: No person may make a parachute jump into or through a cloud.

J. Radio Equipment Requirements. FAR Section 105.14 prescribes the two-way radio communications equipment requirements for aircraft used for parachute jumps in or into controlled airspace. Unless otherwise authorized by ATC, radio communications should be
15. JUMPS OVER OR INTO CONGESTED AREAS OR OPEN AIR ASSEMBLIES OF PERSONS

FAR Section 105.15 requires a certificate of authorization for these jumps (except for emergencies and certain Armed Forces' operations as provided in FAR Section 105.11). An application for a certificate of authorization should be submitted at least 4-working days before the intended jump. The application must be submitted in triplicate on FAA Form 7711-2, Certificate of Waiver or Authorization Application, to the FSDO responsible for the area where the jump is to take place. Applying as early as possible will aid the FAA in processing these certificates.

A. The determination of whether the FAA will issue FAA Form 7711-1, Certificate of Waiver or Authorization, and the special provisions will depend on the circumstances of each case. The two main considerations for issuing an authorization will be the documented skill and experience of the parachutist making the jump and the size of the landing area. Examples of these requirements are:

1. Parachutists who hold a USPA Class C or D license or a member of a Department of Defense (DOD)-sanctioned parachute demonstration team must select a landing area that will permit the jumper to land not closer than 50 feet from any residential dwellings. Even though the landing target can be placed 500 to 600 feet from the fence, the jump is into a congested area. Authorization is required.

2. At the same town, the jumper wishes to change the landing site to a school playground in the eastern part of town. The playground is several acres in size, completely fenced in, but surrounded by residential dwellings. Even though the landing target can be placed 500 to 600 feet from the fence, the jump is into a congested area. Authorization is required.

3. An exhibition jump is planned for a county fair. The fairgrounds are on the north edge of a town with clear, open land on three sides. The jumpers plan to exit their aircraft on one side of the fairground and land on the opposite side. This is a drift-over jump. Authorization is not required.

4. At the same fairgrounds, the target will be placed in the middle of a racetrack, enclosed by a wire mesh fence, and located near the center of the fairgrounds. The target is more than 500 feet from the fence. This would be a jump into an open air assembly of persons. Authorization is required.

5. Jumps made into large areas, even though near or within a populated area or near an open air assembly of persons, do not require written FAA authorization. This provision applies to open areas large enough to enable the parachutists to exit the
aircraft over the area and remain within the area during descent and landing. Since at no time would a jumper be over a congested area, jumps of this nature would not impose a public hazard. However, parachutists should ensure that the landing area is completely clear of assembled persons other than the ground crew and other show performers.

16. JUMPS OVER OR ONTO AIRPORTS

FAR Section 105.17 requires prior approval of the airport management for jumps made over or onto an airport. However, a parachutist may drift over an airport without prior approval if the chute is fully open, he/she is at least 2,000 feet above the airport traffic pattern, and he/she avoids creating a hazard to air traffic or to persons and property on the surface.

17. JUMPS IN OR ONTO CONTROL ZONES

FAR Section 105.19 requires written authorization from the control tower for jumps in or into a control zone with a functioning U.S.-operated tower. Reasonable notice is desirable so that control tower personnel can coordinate the jumps with expected traffic conditions. The authorization and instructions issued by the tower for these jumps are based on VFR and known air traffic and do not relieve the skydiver or the pilot in command of the jump aircraft from compliance with all air traffic and general operating rules. When jumps in or into control zones include jumping over or onto an airport, FAR Section 105.17 must also be complied with as explained in paragraph 16.

18. JUMPS IN OR INTO AIRPORT RADAR SERVICE AREAS

FAR Section 105.20 requires an ATC authorization for jumps in or into an airport radar service area. Each request for authorization issued under this section must be submitted to the ATC tower at the airport for which the airport radar service is designated.

19. JUMPS INTO OR WITHIN POSITIVE CONTROL AREAS AND TERMINAL CONTROL AREAS

FAR Section 105.21 prohibits any person from making a parachute jump and prohibits any pilot in command of an aircraft from allowing a parachute jump to be made from that aircraft in or into a positive control area or terminal control area without, or in violation of, an authorization issued under this section. Further, each request for an authorization issued under this section must be submitted to the nearest ATC facility or FSS.

20. JUMPS IN OR INTO OTHER AIRSPACE

FAR Section 105.23 prescribes the advance notification requirements for parachute jumps in controlled and uncontrolled airspace other than those previously covered in paragraphs 15 through 19. The ATC facility or FSS nearest to the proposed jump site should be notified at least 1 hour before the jump is to be made, but not more than 24 hours before the jump is to be completed.

21. NOTIFICATION OF AN EXTENDED PERIOD OF JUMPING

FAR Section 105.23(b) provides for ATC to accept a written notification from a parachute jumping operation for a scheduled series of jumps to be made over a stated period of time not exceed 12 calendar months. Notification should be filed with the ATC facility at least 15 days, but not more than 30 days, before the jumping activity is to take place.

22. INFORMATION REQUIRED AND NOTICE OF CANCELLATION OR POSTPONEMENT OF JUMP

A. FAR Section 105.25 prescribes that applicants for an authorization under FAR Section 105.19 or FAR Section 105.21 and those submitting a notice under FAR Section 105.23 are to include the following information in that application or notice.

1. The date and time jumping will begin.
2. The size of the parachute landing area expressed in the nautical mile radius around the target.
3. The location of the center of the parachute landing area in relation to:
   a. The nearest very high frequency omnidirectional range (VOR) facility in terms of the VOR radial on which it is located, and its distance in nautical miles from the VOR facility when that facility is 30 nautical miles or less from the parachute landing area or drop zone.
   b. The nearest airport, town, or city depicted on the appropriate Coast and Geodetic Survey World Aeronautical Chart (WAC), or Sectional Aeronautical Chart, when the nearest VOR facility is more than 30 nautical miles from the center of the parachute landing area or drop zone.
4. The altitudes above the surface at which jumping will take place.
5. The duration of the intended jump.
6. The name, address, and telephone number of the person requesting the authorization or giving notice.
7. The identification of the aircraft to be used.
8. The radio frequencies, if any, available in the aircraft.

B. Each person requesting an authorization under FAR Section 105.19 or FAR Section 105.21, and each person submitting a notice under FAR Section 105.23 must promptly notify the FAA ATC facility or FSS from which it requested authorization or which it notified if the proposed or scheduled jumping activity is cancelled or postponed.
23. AIRCRAFT OPERATING AND AIRWORTHINESS REQUIREMENTS

A. Procedure. Owners or operators of aircraft listed in Appendix 2, who are interested in obtaining authorization and operating limitations for these aircraft to be flown with the door open or removed, should forward a written request to the FSDO having jurisdiction over the area in which these operations are to be conducted. The request should contain the following information:

1. Name and address of the registered owner(s) of the aircraft.
2. Make, model, serial, and registration numbers of the aircraft.
3. Place where the aircraft is normally based.
4. Reason the aircraft is to be operated with a door open or removed.

B. Installation and removal of equipment must be handled in accordance with the applicable sections of FAR Part 43. The original alteration to the jump configuration is required to be performed by an appropriately certificated person and recorded in the aircraft records. The equipment list and weight and balance data are required to be revised to show both the jump configuration and the standard configuration. Subsequent conversions may be made by the pilot in command if the work falls within the scope of preventive maintenance (see FAR Part 43, Appendix A, paragraph (c)). The installation or removal of equipment in an aircraft or the increase in passenger loads, other than that already approved for that aircraft, requires some form of FAA approval such as a type certificate data sheet, supplemental type certificate data sheet, or FAA field approval, if applicable. Anyone applying for approval to alter an aircraft for parachute jumping operations should submit sufficient evidence to the local FSDO to permit evaluation of the following:

1. The effect of any aircraft alteration such as door removal or external protuberances on the controllability or handling qualities of the aircraft.
2. The relationship of the maximum number of persons to be carried aboard the aircraft to the emergency exit requirements of FAR Section 91.607, safety belt requirements of FAR Section 91.107, and the aircraft’s published weight and balance envelope for takeoff and landing.
3. The effect of the parachute jump exit procedures to be used, and how they may affect the aircraft weight and balance and controllability during jump operations. Suitable placards will be required to define any special procedures needed to maintain controllability.

William C. Withycombe
Acting Director, Flight Standards Service
### TABLE OF LOCATION FOR JUMP/AUTHORIZATION/NOTIFICATION

AAD: (see AUTOMATIC ACTIVATION DEVICE)

A LICENSE: The first level license which signifies that a skydiver has advanced beyond the student phase. Persons holding a USPA A License are able to jumpmaster themselves, perform basic group freefall jumps and water jumps, participate in certain USPA Collegiate competition events, and pack their own main parachute.

ACCELERATED FREEFALL (AFF), USPA: Harness-hold freefall skydiving student training discipline developed under Ken Coleman and adopted by USPA. AFF-rated USPA Instructors accompany the student in freefall during the initial training jumps.

AGL: Above ground level. Refers to altitude, e.g., 5,000 feet AGL.

AIRCRAFT: Any machine or device, including airplanes, helicopters, gliders, balloons, etc., capable of atmospheric flight. For the purposes of regulation, parachutes are not considered aircraft.

ALTERATIONS: Any change or modification to any part of the parachute assembly from its original manufacturer’s specifications. (see also MAJOR ALTERATION and MINOR ALTERATION)

ALTIMETER: A device that measures height above the surface (altitude); for skydivers, typically above the intended skydiving landing area. (see also AUDIBLE ALTIMETER)

ANGLE OF INCIDENCE: The relative pitch (leading edge up or down) angle of a wing measured between the chord line and the horizon.

ANGLE OF ATTACK: The relative pitch (leading edge up or down) angle of a wing measured between the chord line and the relative wind.

APPROPRIATELY RATED: adj. Refers to a USPA Instructor or Instructor Examiner rated in the method-specific instructional discipline necessary to perform a particular task in accordance with the BSRs.

ARCH: n. Position skydivers use to orient the front of their torso to the relative wind. Described, it is hips forward with back arched; legs extended to 45 degrees, toes pointed; knees at shoulder width; arms bent 90-120 degrees at the shoulders and elbows and relaxed; head up.

ARTISTIC EVENTS: Skydiving competition events that include freestyle, freestyle skydiving, and skysurfing.

AS 8015 (AEROSPACE STANDARD 8015): Standard of tests and minimum safety and performance requirements which must be met to receive approval under technical standard order (TSO) certification. AS 8015A, the standard for TSO C-23c was adopted in 1984 to supercede NAS 804, the standard for TSO C-23b. In June, 1994, AS 8015B became the standard for TSO C-23d.

AUDIBLE ALTIMETER: An alarm used by skydivers to alert them about reaching one or more pre-set altitudes.

AUXILIARY PARACHUTE: (See reserve parachute.)

AUTOMATIC ACTIVATION DEVICE (AAD): A self-contained mechanical or electro-mechanical device that is attached to the interior of the reserve parachute container, which automatically initiates parachute deployment of the reserve parachute at a pre-set altitude, time, percentage of terminal velocity, or combination thereof. (FAR 105 definition)

B-12s: (jar.) Clip hardware sometimes used for leg-strap attachment on a parachute harness. Refers generally to the MS 22044 hardware originally used on the U.S. Army B-12 parachute assembly. (see THREAD-THRU)

B LICENSE: The second level USPA license. Persons holding a USPA B License are authorized to participate in the USPA collegiate 4-way formation skydiving event and perform night jumps.

BAG n. (see DEPLOYMENT DEVICE)

BAG LOCK: n. A malfunction of a deployed parachute where the canopy remains in the deployment bag.

B.A.S.E. JUMPING: An activity involving the use of a parachute for descent from fixed objects. The acronym derives from the first initials of four possible launch categories: buildings, antennae, spans (bridges), and earth (cliffs). Because BASE jumping does not meet the FAA’s definition of “the descent of an object to the surface from an aircraft in flight,” it is not regulated by the FAA or addressed by USPA.

BASE: n. 1. When building a freefall or canopy formation, the initial target individual or group of people to which the others fly. 2. BASE (LEG): n. The portion of the three-legged landing pattern where the jumper flies across the direction of the wind downwind of the landing area before turning for final approach into the wind toward the target.

BASIC SAFETY REQUIREMENTS (BSRs), USPA: Minimum standards overseen and published by USPA and generally agreed upon as the acceptable standard for safe skydiving activities. The BSRs form the foundation of self-governing by skydivers. USPA oversees the BSRs.
BREAKOFF: (see FLAT FLYING)

BOARD OF DIRECTORS (BOD), USPA: Those representatives elected by the general members of USPA every two years as set forth in the USPA By-Laws; authorized by the by-laws to have general charge and control of the affairs, funds, and property of the organization and to carry out the objectives of the organization and its by-laws; elects officers from among current USPA Board Members. The USPA Board of Directors consists of: 1. National Directors—those directors elected at large by the general membership; 2. Regional Directors—those Directors of a specified geographical area, elected by and responsible for representing the interests of the skydivers in a USPA Region; and 3. An ex officio member representing the National Aeronautical Association.

BRAKED TURN: A turn under an open parachute canopy made by using the steering toggles to slow the forward speed of the canopy and then allow one side to fly slightly faster to change heading. Used to reduce altitude loss in a turn.

BRAKES: n. 1. The steering controls of a ram-air parachute. (see also TOGGLES) 2. n. The position of the parachute steering controls, measured in relative increments (quarter brakes, deep brakes, etc.), to control speed and descent in a stable state of flight.

BREAKOFF: n. Procedure in group skydiving where jumpers cease group activity and separate. In freefall, jumpers begin to track at a predetermined altitude for a clear area to open safely; jumpers building canopy formations break off at a predetermined altitude to gain safe separation and allow jumpers to prepare for a landing approach.

BREAK OFF: v. Act of a group of jumpers separating from a freefall or canopy group.

BREAKOFF ALTITUDE: Planned altitude for initiating separation of jumpers during a group jump.

BRIDLE: n. The device, usually made of webbing or tape, connecting the pilot chute to the deployment bag or the canopy.

BSRS: (see BASIC SAFETY REQUIREMENTS, USPA)

C LICENSE: The third level license issued by USPA. USPA C-license holders may apply when qualified for the USPA Coach rating, ride as passenger on USPA Tandem Instructor training and rating renewal jumps, and participate in intermediate-altitude jumps.

CANOPY: The major component of the parachute system comprised of fabric membranes that connect to the parachute harness by suspension lines and provide the means for the jumper to descend safely.

C LICENSE: The third level license issued by USPA. USPA C-license holders may apply when qualified for the USPA Coach rating, ride as passenger on USPA Tandem Instructor training and rating renewal jumps, and participate in intermediate-altitude jumps.

COACH: n. A non-rated operative who provides advanced skydiving training. (see also COACH, USPA)

COACH, USPA: n. The entry-level USPA instructional rating whose holder may teach the general (non-method specific sections of the first-jump course) and conduct group freefall skills training and jumps with students, all under the supervision of a USPA Instructor.

COLLAPSIBLE PILOT CHUTE: A hand-deployed pilot chute that automatically collapses after deployment.

COLLAPSIBLE SLIDER: A slider rigged so the jumper can compress or wrap it to reduce drag (see also SLIDER).

CONTAINER: The portion of the parachute system that closes around and stores the folded parachute canopy and deployment device until deployment.

CORK: v. (jar.) During high-speed group freefall maneuvers, to lose control and decelerate rapidly.
GLOSSARY

CROSS BRACED: (adj.) Refers to a canopy designed with longitudinal trussing between the vertical ribs to flatten and stiffen the wing in flight.

CROSS CONNECTORS: Straps attached between the risers. Used for canopy formation, they should be from front to rear only to prevent the docked jumper from sliding back up the lines. Especially important for plane formations. Also used with some reserve static-line systems and attached from side to side to prevent premature reserve deployment if only one riser is released.

CROSSPORT: n. A vent cut into the structural rib of a parachute canopy to equalize air pressure between two cells.

CROSSWIND: Perpendicular to the direction of the wind.

CREW: (see CANOPY FORMATION)

CUTAWAY (n): Procedure where the jumper releases from the main parachute prior to activating the reserve parachute. Used in the event of a main parachute malfunction to prevent an entanglement with the deploying reserve; in the event of a canopy entanglement with another jumper; and also in case the wind causes the canopy to drag a jumper after landing.

CUTAWAY HANDLE: Pillow or loop handle of a two-handled system, normally located on the jumpers right-side chest, used to initiate a cutaway. Sometimes referred to as a three-ring release handle.

D LICENSE: The fourth and highest level or license issued by USPA. USPA D-license holders may participate in all competitions at the national level, apply for certification for all USPA instructional and proficiency ratings, and participate in high-altitude jumps and record attempts.

DELTA: Freefall position with legs extended and arms back to initiate a forward dive.

DEMONSTRATION JUMP (DEMO): (see EXHIBITION JUMP.

DENSITY ALTITUDE: An expression of air density relative to standard atmospheric pressure at sea level. The pilot calculates field elevation and temperature and compares the result with an equivalent altitude MSL at standard temperature.

DEPLOYMENT: After activation, extraction of the parachute from the container and full extension of the system prior to inflation.

DEPLOYMENT DEVICE: Intermediate container, usually a bag (D-bag), that contains or constricts the folded parachute through complete line deployment.

DIAPER: A type of deployment device consisting of a fabric panel attached near the lower part of a canopy which prevents canopy inflation until full line stretch. Used frequently with round parachutes to reduce opening shock and malfunctions.

DIRECT SUPERVISION: 1. The attentive oversight of an activity taking place in the immediate presence of the supervisor, who is personally responsible for the proper conduct of the activity. (USPA definition) 2. A certificated rigger personally observes a non-certificated person packing a main parachute to the extent necessary to ensure that it is being done properly, and takes responsibility for that packing. (FAR 105 definition) (see also SUPERVISION)

DIVE BLOCKS: Hand grips (not loops) on the front risers to facilitate diving the canopy.

DIVE LOOPS: Handles on the front risers to facilitate diving the canopy.

DIVER EXIT: Leaving an aircraft by diving out of the aircraft door; made without positioning or bracing to achieve a stable entry into the airstream.

DOCK: v. To make physical controlled contact with another skydiver while in freefall; or, when building canopy formations, with another jumper’s canopy.

DOOR EXIT: (see DIVER EXIT)

DOWNWIND: 1. adj. The direction toward which the air is moving. 2. adv. or adj. positioned farther along the wind’s path. 3. n. (jar.) a downwind-facing landing.

DOWNWIND LEG: The portion of the landing approach flown with the wind blowing from behind the jumper.

DROGUE: A trailing drag device used to retard the movement of an object through the air, used in skydiving to regulate the fall rate of tandem skydivers.

DROGUEFALL: In tandem skydiving, the portion of the descent where a drogue has been deployed between freefall and main parachute deployment.

DROP ZONE: n. 1. Skydiving establishment or intended parachute landing area. (USPA definition) 2. Any pre-determined area upon which parachutists or objects land after making an intentional parachute jump or drop. The center-point target of a drop zone is expressed in nautical miles from the nearest VOR facility when 30 nautical miles or less; or from the nearest airport, town, or city depicted on the appropriate Coast and Geodetic Survey World Aeronautical Chart or Sectional Aeronautical Chart, when the nearest VOR facility is more than 30 nautical miles from the drop zone. (FAR 105 definition) (see also SANCTIONED DROP ZONE)

DUAL ASSEMBLY: Refers to a two-canopy parachute system. Includes the main and reserve canopies, harness and container system, and all other components.

DUMMY RIPCORD PULL (DRCP): (see PRACTICE DEPLOYMENT)
DYNAMIC STALL: n. An action that occurs following the flare of a ram-air canopy, where the load ( jumper) has swung forward under the canopy from the braking action and begins to swing back. (see also REVERSE FLIGHT and STALL)

EMERGENCY PARACHUTE: A certificated parachute which is intended for emergency use; typically, the parachute a pilot wears.

END CELL: The last chordwise section of a parachute canopy on either end.

END CELL CLOSURE: Deflated end cell. Routine opening problem, usually correctable.

ELLIPICAL: n., adj. (jar.) Refers to a class of canopies with a tapered or approximately elliptical planform.

EXHIBITION JUMP: An exhibition jump, also called a display or demonstration jump, is a jump at a location other than an existing drop zone done for the purpose of reward, remuneration, or promotion and principally for the benefit of spectators.

EXIT POINT: The point on the ground over which skydivers leave the aircraft.

EXIT WEIGHT: The combined weight of the jumper and all his or her equipment for that jump.

FAA (see FEDERAL AVIATION ADMINISTRATION)

FAI: (see FEDERATION AERONAUTIQUE INTERNATIONALE)

FARMER McNASTY: (jar.) Unenlightened term for a disen- chanted drop zone neighbor with whom communications with jumpers are strained or have broken down. 

FEDERAL AVIATION ADMINISTRATION (FAA): An agency of the U.S. Department of Transportation whose primary function and responsibility is to control the nation’s air traffic, including the certification of all civil aircraft and accessories, licensing of all civil pilots, mechanics, and riggers, and administration of the Federal Aid to Airports Program.

FEDERATION AERONAUTIQUE INTERNATIONALE (FAI): An international organization which governs all aviation sports, certifies all official aviation and space records, and governs official international competitions. Operates through a non-profit National Aero Club in each country.

FINAL APPROACH: The final portion of flight before a jumper or aircraft lands.

FLARE: 1. v. (Under canopy: To convert the downward speed of a parachute momentarily into lift. 2. v. In freefall: To decelerate prior to approaching a formation. 3. n. The act of flaring. 4. n. A membrane used to distribute the load of a parachute at the line attachment points of some canopies.

FLAT FLYING: Freefall orientation primarily belly to earth.

FLAT DELTA: Freefall position with the body on one plane, legs extended and arms swept back, used as a starting or intermediate position when developing a track.

FLOATER: A jumper positioned outside the aircraft to leave slightly prior to the person or group designated as the target for the initial freefall formation (see also BASE). A floater maneuvers from a position below the base relative to the horizon.

FOREIGN PARACHUTIST: A parachutist who is neither a U.S. citizen nor a resident alien and is participating in parachute operations within the United States using parachute equipment not manufactured in the United States. (FAR 105 definition)

FORMATION SKYDIVING (RELATIVE WORK): 1. Aerial maneuvers by two or more freefalling skydivers with each other, usually to form geometric formations. 2. Competition discipline of flat-flying.

FREEFALL: The portion of a parachute jump or drop between aircraft exit and parachute deployment in which the parachute is activated manually by the parachutist at the parachutist’s discretion or automatically, or, in the case of an object, is activated automatically. (FAR 105 definition)

FREE FLY: v. To exit unlinked with other jumpers.

FREEFLYING: n. 1. An unrestricted freefall discipline characterized by varied presentations to the relative wind. (see also SIT FLYING and HEAD DOWN) 2. n. The competition event of freeflying.

FREESTYLE: 1. A solo freefall discipline that involves choreographed multi-orientation static and dynamic maneuvers. 2. The competition event of freestyle performed as part of a team with a camera flyer (freestyle skydiving).

FULL FLIGHT: The stabilized state of hands-off canopy flight under an open and fully functioning parachute.

GLIDE: n., v. The combined horizontal and vertical movement of a descending canopy.

GLIDE ANGLE: The trajectory of a wing expressed as the distance forward to altitude lost, e.g., a 3:1 glide angle means the wing will travel three feet forward for every foot downward.

GO-AROUND: n. (jar.) An in-flight operation where the aircraft circles at jump altitude.
H

HAND-DEPLOYED PILOT CHUTE: A small parachute thrown by hand in freefall to extract the main parachute from its container. (see also PULL OUT and THROW OUT)

HARNESS: n. The webbing of a parachute system that surrounds and retains a jumper.

HARNESS AND CONTAINER SYSTEM: The major component of a parachute system, usually unitized, which the jumper dons for the jump. It contains the canopies and certain accessory devices.

HARNESS HOLD: A skydiving training discipline where a student is trained for independent, solo freefall but is accompanied by at least one USPA AFF Instructor until meeting the requirements in the BSRs for self-supervision in freefall. On the initial jumps, the AFF Instructor(s) assist the student on exit via a harness grip.

HEAD DOWN: adj., adv. Inverted vertical or nearly vertical freeflying orientation.

HOOK KNIFE: A hook-shaped knife with an inside cutting edge. Used in certain emergencies to sever problem lines or components of a parachute system.

HOOKER HARNESS: A single-point aircraft passenger restraint system that integrates with a parachute harness. Designed by Jack Hooker.

HOOK TURN: (jar.) A canopy maneuver that results in a steep dive.

HORSESHOE: n. A partial parachute malfunction where part of the deployed parachute is entangled with the jumper or his or her equipment.

INSTRUCTOR RATING COURSE, USPA: A course registered with USPA Headquarters to train, qualify, and test applicants for the USPA Instructor rating.

INSTRUCTOR EXAMINER (I/E), USPA: The highest level of the instructional rating program. An I/E is an experienced USPA Instructor who has met additional proficiency requirements and passed a series of written examinations on a wide variety of skydiving related subjects. An I/E has all of the privileges of a USPA Safety & Training Advisor.

INSTRUCTIONAL RATING MANUAL (IRM), USPA: The manual containing the collected documents and references required to conduct any course for USPA Coach or USPA Instructor ratings.

J

JUDGE: The official who evaluates a competitor’s performance. USPA issues judge ratings at both the Regional and National levels. The FAI issues a rating for internationally recognized judges.

JUMP ALTITUDE: Actual altitude of an aircraft above the ground at the time a skydiver exits.

JUMP RUN: The flight of the aircraft prior to exit, generally following a predetermined path.

JUMPMASTER: n. 1. A skydiver, typically a senior jumper or instructional rating holder, who coordinates boarding and exit order, jump flight procedures, spotting, and emergency operations with the pilot. 2. v. To dispatch jumpers. 3. n. Prior to 2002, a USPA instructional rating for supervising student jumps.

LANDING PATTERN: n. The deliberate flight path, usually rectangular, that a jumper uses in the final phase of descent under canopy.

LINE DOCK: The docking of two canopies with the docker’s canopy above the head of the person receiving the dock.

LICENSE: Certificate of proficiency recognizing that a skydiver has met a specified level of experience, skill, and knowledge. There are four classes of USPA licenses: A, B, C and D. USPA licenses are recognized internationally through the FAI.

LINE TWIST: n. A condition of parachute opening where the canopy has attained full or nearly full inflation but one or more complete twists have developed in the lines and/or risers. Can be dangerous when associated with a spin.

LINEOVER: n. A partial malfunction of a deployed parachute resulting in lines going over the top of the canopy. Also refers loosely to the partial inversion of a round canopy. (see also PARTIAL INVERSION)
Glossary

M

MAE WEST: n. (jar., archaic) WWII term for partial inversion. (see also PARTIAL INVERSION)

MAIN PARACHUTE: A parachute worn as the primary parachute used or intended to be used in conjunction with a reserve parachute. (FAR 105 definition)

MAINTENANCE: Inspection, overhaul, repair, preservation, and replacement of parts.

MAJOR ALTERATION: An alteration not listed in the manufacturer's specifications that might appreciably affect weight, structural strength, performance, flight characteristics, or other qualities affecting airworthiness or that cannot be done by elementary operations. (see also ALTERATION and MAJOR ALTERATION)

MAJOR REPAIR: A repair that if improperly accomplished may affect weight, structural strength, performance, flight characteristics, or other qualities which determine airworthiness.

MALFUNCTION: The complete or partial failure of a parachute canopy to accomplish proper opening, descent, or flight characteristics.

MASTER RIGGER: The higher of two certification levels for FAA riggers. May perform more complex repair tasks and approved alterations. (see also SENIOR RIGGER)

MINI THREE-RING: Refers to a scaled-down version of the original three-ring release system. (see also THREE-RING RELEASE)

MINOR ALTERATION: An alteration other than a major alteration. (see also ALTERATION and MAJOR ALTERATION)

MINOR REPAIR: A repair other than a major repair. (see also MAJOR REPAIR)

MSL: Altitude measured from sea level.

N

NAA (see NATIONAL AERONAUTICAL ASSOCIATION)

NAS 804: (National Aircraft Standard 804) defines the tests and minimum performance and safety standards which must be met for a parachute to receive approval under TSO C-23b. Adopted in 1949 and superseded in 1984 by AS 8015A.

NASSER TOGGLES: Control loops on the front risers attached to one or more A or A-B lines to facilitate diving the canopy toward a canopy formation. Designed by Nasser Basir.

NATIONAL AERONAUTICAL ASSOCIATION (NAA): The National Aero Club of the USA which represents the FAI. USPA is a division of the NAA.

NATIONAL DIRECTOR: (see BOARD OF DIRECTORS).

NIGHT JUMP: A skydive made from one hour after official sunset to one hour before official sunrise. The FAA considers any jump made after sunset and before sunrise a night jump requiring equipment specified in FAR 105.

NOTAM (NOTICE TO AIRMEN): An air traffic advisory or notice filed with an FAA Flight Service Station by an airspace user.

OBJECT: Any item other than a person that descends to the surface from an aircraft in flight when a parachute is used or is intended to be used during all or part of the descent. (FAR 105 definition)

OPEN BODY OF WATER: A body of water in which a skydiver could drown.

OPENING POINT: The ground point of reference over which the skydiver opens the parachute.

OPENING SHOCK: (jar.) The decelerating force exerted on the load as the parachute deploys and inflates. Caused by the resistance of the canopy and items associated with it.

OSCILLATION: 1. The swinging or pendulum motion of the suspended load under a canopy. 2. In canopy formation, the swaying or swinging of a formation caused by poor docking, turbulent air, or too much movement of the people in the formation.

OUTBOARD: Facing to the outside, such as a ripcord facing to the side of the jumper rather than toward the breast bone.

PACK: v. To fold and close a parachute system in preparation for jumping.

PARACHUTE: A fabric device that slows the descent of a falling object; derived from the French words “para,” to shield, and “chute,” to fall. Thus, parachute literally means “to shield from a fall.”

PARACHUTE DROP: The descent of an object to the surface from an aircraft in flight when a parachute is used or intended to be used during all or part of that descent. (FAR 105 definition)

PARACHUTE JUMP: A parachute operation that involves the descent of one or more persons to the surface from an aircraft in flight when an aircraft is used or intended to be used during all or part of that descent. (FAR 105 definition)
PARACHUTE LANDING FALL (PLF): n. A method developed by the U.S. military to minimize the chance of injury from a hard landing under parachute. The jumper distributes the force of the landing in an orderly manner over the most robust areas of the body.

PARACHUTE OPERATION: The performance of all activity for the purpose of, or in support of, a parachute jump or a parachute drop. This parachute operation can involve, but is not limited to, the following persons: parachutist, parachutist in command and passenger in tandem parachute operations, drop zone or owner or operator, jump master, certificated parachute rigger, or pilot. (FAR 105 definition)

PARACHUTIST: A person who intends to exit an aircraft while in flight using a single-harness, dual parachute system to descend to the surface. (FAR 105 definition) (see also SKYDIVER)

PARACHUTIST IN COMMAND: The person responsible for the operation and safety of a tandem parachute operation. (FAR 105 definition)

PARAGLIDING n. (also PARAPENTE): An activity involving the use of a ram-air inflated wing, resembling a parachute, for gliding. Flights typically initiate by foot-launching from a hill or from a ground-based tow. Because paragliding jumping does not meet the FAA’s definition of “the descent of an object to the surface from an aircraft in flight,” it is not regulated by the FAA or addressed by USPA.

PARTIAL INVERSION: Inflation malfunction of a round canopy where one side passes through and inflates between two lines of the other side, resulting in two inflated lobes. (see also LINEOVER)

PARACHUTIST IN COMMAND: Means the person responsible for the operation and safety of a tandem parachute operation. (FAA definition) Not necessarily a USPA instructional rating holder.

PASSENGER PARACHUTIST: A person who boards an aircraft, acting as other than the parachutist in command of a tandem parachute operation, with the intent of exiting the aircraft while in flight using the forward harness of a dual harness tandem parachute system to descend to the surface. (FAR 105 definition)

PERMEABILITY: The amount or volume of air which can pass through a fabric assembly.

PILOT CHUTE: A small parachute used to initiate and/or accelerate deployment of a main or reserve parachute. (FAR 105 definition)

PILOT CHUTE ASSIST: A method of rigging a static line to a parachute where the static line opens the container and positively extracts the pilot chute before separating from the system. Typically a velcro strip or break cord of known strength is used.

PIN 1. v. To fly to another jumper and take grips on the jumper (freefall) or canopy (canopy formation). 2. n. The first jumper to make contact with the base, or target jumper, to begin a formation. 3. n. Retaining device that when passed through a closing loop, locks the parachute system closed until activation.

PIN CHECK: n. (jar.) Pre-jump inspection of the parachute.

PLF (see PARACHUTE LANDING FALL)

PLANIFORM: The shape or footprint of a wing surface.

PLANING: v. The act of compressing a parachute stack.

POISED EXIT: A departure from an aircraft wherein the jumper uses an external structure as a brace to assist in gaining a stable position immediately upon leaving the aircraft.

POROSITY: The ratio of open area to closed area in a fabric. Graded as high, low, or zero. Tightly woven and treated material has a lower porosity than loosely woven material.

PRACTICE DEPLOYMENT: An in-air exercise used to learn how to locate an operate a parachute deployment handle prior to opening. It may consist of pulling or throwing a practice or dummy handle (instructor-assisted deployment or static-line jumps) or touching the actual deployment handle in freefall or tandem droguefall.

PREMATURE OPENING: Unintentional opening of a parachute.

PROP BLAST: 1. n. The airflow created by a propeller that is developing thrust. 2. n. (jar.) relative wind on exit

PUD n. (jar.) An aerodynamically low-profile, soft handle that is ergonomically designed to fit into a clenched fist. Used for various parachute operation handles.

PULL OUT: n. A type of hand-deployed parachute activation system. The jumper pulls a handle connected to the container closing pin and the internally packed pilot chute. (see also HAND DEPLOYED PILOT CHUTE)

PULL-UP CORD: A packing aid used to thread the closing loop through eyelets in the container and removed once the closing pin is inserted.

RAM-AIR PARACHUTE: A parachute with a canopy consisting of an upper and lower surface that is inflated by ram air entering through specially designed openings in the front of the canopy to form a gliding airfoil. (FAR 105 definition)

RATING RENEWAL SEMINAR, USPA: A meeting of USPA instructional rating holders to exchange information, introduce and discuss new ideas, and to develop, improve, or assure the quality of skydiving instruction.
RECOMMENDATIONS, USPA: Principles, policies, and concepts applicable to skydiving or a related subject which are derived from experience or theory, compiled by USPA, and offered for guidance.

REGIONAL DIRECTOR, USPA: Members of the USPA Board elected from a specified geographical area and responsible for representing the interests of the skydivers in that USPA Region.

RELATIVE WIND: The relative airflow opposite a body’s trajectory, irrespective of the horizon.

RELATIVE WORK (RW): (see FORMATION SKYDIVING)

RESERVE PARACHUTE: An approved parachute worn for emergency use to be activated only upon failure of the main parachute or in any other emergency where use of the main parachute is impractical or use of the main parachute would increase risk. (FAR 105 definition)

RESERVE STATIC LINE (RSL): A connection between the main risers and the reserve activation system intended to initiate reserve activation following the release of a deployed main parachute.

REVERSE FLIGHT (FULL STALL): A non-flying canopy maneuver that collapses the canopy and may cause it to spin. Results from depressing the toggles until the trailing edge is lower than the leading edge. May result in an unrecoverable malfunction. (see also STALL and DYNAMIC STALL)

RIB: A vertical and longitudinal fabric membrane that forms the airfoil shape and primary structure of a ram-air canopy.

RISER DOCK: In canopy formation, a momentum dock that puts the risers into the hands of the receiver. A very advanced technique.

RIG: (jar.) 1. n. The complete parachute system used for skydiving. 2. v. The act of maintaining, repairing, or modifying a parachute system. 3. v. To don a parachute (RIGGING UP).

RIGGER: An FAA-certificated parachute technician. (see also MASTER RIGGER and SENIOR RIGGER)

RIPCORD: An assembly, usually constructed with a metal cable that, when pulled, activates an operation on a parachute system.

RISER(S): Webbing straps that connect the main lift webs of the parachute harness to the lines of the canopy.

RISER LOOPS; RISER BLOCKS: Gripping loops or devices on a riser that make it easier to grasp.

RSL: (see RESERVE STATIC LINE)

SAFETY & TRAINING ADVISOR (S&TA), USPA: A local person appointed by the USPA Regional Director as his or her representative and who is available to provide advice and administrative assistance as the USPA representative at an individual drop zone or specified area.

SANCTIONED DROP ZONE: A drop zone which has been verified by a USPA Safety & Training Advisor or a USPA Regional Director as complying with the minimum drop zone requirements as stated in the USPA Basic Safety Requirements section of the USPA Skydiver's Information Manual. (see also DROP ZONE)

SENIOR RIGGER: The initial certification level for FAA riggers that allows its holder to pack and maintain a parachute system and perform simple repairs. (see MASTER RIGGER)

SINGLE-HARNESS, DUAL-PARACHUTE SYSTEM: The combination of a main parachute, approved reserve parachute, and approved single-person harness and dual-parachute container. This parachute system may have an operational automatic activation device installed. (FAR 105 definition)

SINGLE OPERATION SYSTEM (SOS): Refers to a parachute harness and container operation system with a combined single-point riser release and reserve ripcord handle. Pulling one handle will both release the risers and pull the reserve. (see also TWO-HANDED SYSTEM)

SIT FLYING: Upright vertical freely orientation based on a seated position. (see also CHUTE ASSIS)

SKYBOARD: (see SURFBOARD)

SKYDIVE: 1. n. The descent of a person to the surface from an aircraft in flight when he or she uses or intends to use a parachute during all or part of that descent. 2. v. To jump form an aircraft with a parachute.

SKYDIVER: A person who engages in skydiving.

SKYSURFER: A skydiver who jumps with a surfboard (skyboard).

SKYSURFING: 1. A freefall skydiving discipline using a specially rigged surfboard (skyboard). 2. The competition event by that name.

SLIDER: A device which controls a canopy’s inflation by progressively sliding down the suspension lines during inflation. Found on most ram-air canopies.

SLINKS: A type of Spectra fabric connector link developed by Performance Designs, Inc., for attaching the lines of the parachute to the risers.

SOLO STUDENT: A skydiving student who uses a single-harness, dual-parachute system.
SOS: (see SINGLE-OPERATION SYSTEM)

SPAN: The dimension of a wing measured from tip to tip.

SPOTTING: Selecting the correct ground reference point over which to leave the aircraft, selecting the course for the aircraft to fly, and directing the pilot on jump run to that point.

STABLE FREEFALL POSITION: A position attained by a freefalling skydiver in which only controlled, planned movements are made.

STABILITY: That property of a body which causes it, when its equilibrium is disturbed, to develop forces or movements tending to restore the original condition. In skydiving, control of body position during freefall.

STACK: A vertical canopy formation with the jumpers gripping the canopy or lines just below the canopy.

STATIC LINE: A line of cable or webbing, one end of which is fastened to the parachute, the other to some part of the aircraft, used to activate and deploy or partially deploy the parachute as the load falls away from the aircraft.

STATIC-LINE JUMP: A parachute jump during which a static line is used to deploy or partially deploy the parachute. Used for training student skydivers.

STALL: n. The state of canopy flight control characterized by decreased glide and increased rate of descent. (see DYNAMIC STALL and REVERSE FLIGHT)

STEP-THROUGH: (see THREAD-THROUGH)

STUDENT: A skydiver trainee who has not been issued a USPA A license.

SUPERVISION: The general oversight of an activity taking place where the supervisor is readily available for counsel and direction and who is responsible that the activity is satisfactorily completed. (see DIRECT SUPERVISION)

SURFBOARD (SKYBOARD): n. A rigid panel, similar to a snowboard, attached to a jumper’s feet.

SUSPENSION LINES: Cords, attached from the bottom of the parachute canopy to the risers, that distribute and suspend the weight of a skydiver under the inflated canopy.

SWOOP: 1. v. To rapidly dive toward and then make a controlled approach relative to a target. 2. n. The controlled flight from above of one body to meet or fly close to another body, a stationary object, or the ground.

SWOOP POND; SWOOP DITCH: A water obstacle used as a high-performance landing area.

TANDEM JUMPING: A method of skydiving, typically used for training student skydivers or introducing newcomers to the sport, where one jumper shares a tandem parachute system with another.

TANDEM PARACHUTE OPERATION: A parachute operation in which more than one person simultaneously uses the same tandem parachute system while descending to the surface from an aircraft in flight. (FAR 105 definition)

TANDEM PARACHUTE SYSTEM: The combination of a main parachute, approved reserve parachute, and approved harness and dual parachute container, and a separate approved forward harness for a passenger parachutist. This parachute system must have an operational automatic activation device installed. (FAR 105 definition)

TARGET: The landing area on a drop zone. For officially sanctioned competition, a three-centimeter disk.

TECHNICAL STANDARD ORDER (TSO): Issued by the FAA, requires compliance with minimum performance standards and specifications for material and products. Parachute specifications are referenced in TSO-C23.

TERMINAL VELOCITY: The equilibrium velocity that a freefalling body can attain against the resistance of the air. The greatest speed at which a body falls through the atmosphere.

THREAD-THROUGH (STEP-THROUGH): (jar.) n. A leg strap configuration on a parachute harness that uses a single piece of adjustable hardware. The leg strap must be unthreaded to be disconnected, or the jumper simply steps into the connected leg straps when donning the rig. (see B-12s)

THREE-RING RELEASE: A type of single point release invented by Bill Booth. The system is based on three interlocking rings on each riser held in place by a small loop that is retained by a cable. Pulling one handle releases both main risers simultaneously or nearly simultaneously.

THROW OUT: 1. n., adj. A type of hand-deployed parachute activation system. The pilot chute is folded into an external pouch, extracted and thrown. A curved closing pin or equivalent locking device on the bridle is extracted as jumper falls away from the pilot chute and bridle, allowing the container to open. (see HAND DEPLOYED PILOT CHUTE) 2. v. (jar.) To initiate deployment.

TOGGLES: n. Handles attached to the ends of the steering lines of a parachute canopy. (see also BRAKES)

TRACK: 1. n. A freefall position with the legs fully extended, knees locked, arms swept back, elbows locked, and torso fully extended and slightly bowed forward to achieve the maximum horizontal speed. 2. v. To move at maximum horizontal speed in freefall.
TRIM TABS: A front riser pulley system for adjusting a canopy's angle of incidence or flight attitude.

TSO-C23: (see TECHNICAL STANDARD ORDER)

TURBULENCE: Disturbed air that can affect canopy flight and integrity.

TWO-HANDED SYSTEM: Refers to a parachute harness and container operation system that uses separate handles for the canopy release and for reserve activation. (see SINGLE OPERATION SYSTEM)

UNITED STATES PARACHUTE ASSOCIATION (USPA): A not-for-profit, voluntary membership association of skydivers whose purpose is promoting and representing skydiving. As a division of the NAA, it is the official representative of the FAI for skydiving in the U.S.

UPWIND: The direction from which the wind is blowing.

WAIVER: 1. Exception to the BSRs filed by a USPA official indicated in SIM Section 2-2. 2. (jar.) A liability release.

WATER JUMP: A skydive which includes intentionally landing in an open body of water.

WIND DRIFT INDICATOR (WDI): A device used to determine the wind drift which a descending parachute will experience, so constructed as to descend at a rate comparable to a skydiver of average weight descending under a fully deployed main canopy of average specifications. Usually a weighted strip of crepe paper 10 inches wide and 20 feet long.

WING SUIT: A gliding jumpsuit designed with fabric membranes between the legs of the jumper and from each arm to the torso.

WHUFFO: n. (jar.) Term for a non-skydiver (“Whuffo you jump out of airplanes?”) Considered insensitive.
FREEFALL HAND SIGNALS

arch

deploy the parachute (pull)

pelvis forward

check arm position

extend legs six inches and hold

legs in (retract legs slightly)

circle of awareness (altitude check)

relax (breathe)

perform the practice deployment sequence

knees together slightly—or—
toe taps

A. Exam Study Instructions

1. Use this guide to find the correct areas of the Skydiver’s Information Manual to study for USPA license written exams.

2. Study guide information for the oral USPA A license exam is listed in the “Book Stuff” at the beginning of each Category of the Integrated Student Program in SIM Section 4.

3. Look in SIM Section 3 for more information on licenses and all license exams.

4. Refer to the USPA B, C, and D license application and written exam answer sheet included in SIM Appendix C.
