Ding and Wang

• **Recovery task**: Recover $x^{\sharp} \in \mathbb{R}^n$ from $A \in \mathbb{R}^{m \times n}$, $b = A(x^{\sharp})$

Related: Candes and Tao [2005], Recht et al. [2010], Candès et al. [2013]

Ding and Wang

- **Recovery task**: Recover $x^{\sharp} \in \mathbb{R}^n$ from $A \in \mathbb{R}^{m \times n}$, $b = A(x^{\sharp})$
- Suppose A entrywise i.i.d. $N(0, 1/m^2)$

$$\left|\operatorname{supp}(x^{\sharp})\right| \le k \ll n \qquad m \asymp k \log(n)$$

Related: Candes and Tao [2005], Recht et al. [2010], Candès et al. [2013]

- **Recovery task**: Recover $x^{\sharp} \in \mathbb{R}^n$ from $A \in \mathbb{R}^{m \times n}, b = A(x^{\sharp})$
- Suppose A entrywise i.i.d. $N(0, 1/m^2)$

$$\left|\operatorname{supp}(x^{\sharp})\right| \le k \ll n \qquad m \asymp k \log(n)$$

• Conceptual approach $\min_{x \in \mathbb{R}^n} \{ |\operatorname{supp}(x)| : Ax = b \}$

Related: Candes and Tao [2005], Recht et al. [2010], Candès et al. [2013]

- **Recovery task**: Recover $x^{\sharp} \in \mathbb{R}^n$ from $A \in \mathbb{R}^{m \times n}$, $b = A(x^{\sharp})$
- Suppose A entrywise i.i.d. $N(0, 1/m^2)$

$$\left|\operatorname{supp}(x^{\sharp})\right| \le k \ll n \qquad m \asymp k \log(n)$$

- Conceptual approach $\min_{x \in \mathbb{R}^n} \{ |\operatorname{supp}(x)| : Ax = b \}$
- Convex optimization approach: In this regime, x^{\sharp} is unique minimizer of

$$(\textbf{Constrained}) \qquad \min_{x \in \mathbb{R}^n} \left\{ \|x\|_1 : Ax = b \right\}$$

Ding and Wang

$$\begin{array}{c|c} x^{\sharp} & A \in \mathbb{R}^{m \times n} & (A, b) \\ \hline & b = A(x^{\sharp}) & \end{array} \begin{array}{c} Opt. alg. for (Constrained) & \tilde{x} \\ \hline & & \end{array}$$

• If no noise in sensing process and no error in optimization algorithm, $\tilde{x} = x^{\sharp}$

$$\begin{array}{c|c} x^{\sharp} & A \in \mathbb{R}^{m \times n} & (A, b) \\ \hline & b = A(x^{\sharp}) & \end{array} \begin{array}{c} \text{Opt. alg. for (Constrained)} & \tilde{x} \\ \end{array}$$

- If no noise in sensing process and no error in optimization algorithm, $\tilde{x}=x^{\sharp}$
- Questions:

$$\begin{array}{c|c} x^{\sharp} & A \in \mathbb{R}^{m \times n} \\ \hline & b = A(x^{\sharp}) \end{array} \xrightarrow{(A, b)} \\ \hline & \text{Opt. alg. for (Constrained)} \\ \hline & \tilde{x} \\ \hline & \end{array} \\ \end{array}$$

- If no noise in sensing process and no error in optimization algorithm, $\tilde{x} = x^{\sharp}$
- Questions:
 - What if the algorithm receives $\tilde{b} = A(x^{\sharp}) + \delta$?

$$\begin{array}{c|c} x^{\sharp} & A \in \mathbb{R}^{m \times n} \\ \hline & b = A(x^{\sharp}) \end{array} \xrightarrow{(A, b)} \\ \hline & \text{Opt. alg. for (Constrained)} \\ \hline & \tilde{x} \\ \hline & \end{array}$$

- If no noise in sensing process and no error in optimization algorithm, $\tilde{x} = x^{\sharp}$
- Questions:
 - What if the algorithm receives $\tilde{b} = A(x^{\sharp}) + \delta$?
 - What if algorithm only produces a ϵ -optimal and ϵ -feasible solution?

$$\begin{array}{c|c} x^{\sharp} & A \in \mathbb{R}^{m \times n} \\ \hline & b = A(x^{\sharp}) \end{array} \xrightarrow{(A, b)} \\ \hline & \text{Opt. alg. for (Constrained)} \\ \hline & \tilde{x} \\ \hline & \end{array}$$

- If no noise in sensing process and no error in optimization algorithm, $\tilde{x} = x^{\sharp}$
- Questions:
 - What if the algorithm receives $\tilde{b} = A(x^{\sharp}) + \delta$?
 - What if algorithm only produces a ϵ -optimal and ϵ -feasible solution?
 - What algorithm to apply to (Constrained) / other convex problem?

1 Motivation: Sparse recovery

Ding and Wang

• Penalty formulation: let $r \simeq \sqrt{k}$ and define

$$F(x) \coloneqq \left\| x \right\|_1 + \frac{r \left\| Ax - b \right\|_1}{r \left\| Ax - b \right\|_1}$$

• Penalty formulation: let $r \simeq \sqrt{k}$ and define

$$F(x) \coloneqq \|x\|_1 + \frac{r \|Ax - b\|_1}{r \|Ax - b\|_1}$$

$$\begin{array}{c|c} x^{\sharp} & A \in \mathbb{R}^{m \times n} \\ \hline & b = A(x^{\sharp}) \end{array} \xrightarrow{(A, b)} \\ \begin{array}{c} \text{Opt. alg. for } F \\ \hline & \tilde{x} \end{array} \\ \end{array}$$

• Penalty formulation: let $r \simeq \sqrt{k}$ and define

$$F(x) \coloneqq ||x||_1 + \frac{r ||Ax - b||_1}{r ||Ax - b||_1}$$

$$\begin{array}{c|c} x^{\sharp} & A \in \mathbb{R}^{m \times n} \\ \hline & b = A(x^{\sharp}) \end{array} \xrightarrow{(A, b)} \\ \begin{array}{c} \text{Opt. alg. for } F \\ \hline & \tilde{x} \end{array} \end{array}$$

Theorem (Structural)

F is μ -sharp in the ℓ_1 norm with $\mu \simeq 1$

$$F(x) - F(x^{\sharp}) \ge \mu \left\| x - x^{\sharp} \right\|_{1}, \qquad \forall x$$

and L-Lipschitz in the ℓ_1 norm with $L \asymp \sqrt{k}$

$$|F(x) - F(y)| \le L ||x - y||_1, \quad \forall x, y.$$

• Penalty formulation: let $r \simeq \sqrt{k}$ and define

$$F(x) \coloneqq ||x||_1 + \frac{r ||Ax - b||_1}{r ||Ax - b||_1}$$

$$\begin{array}{c|c} x^{\sharp} & A \in \mathbb{R}^{m \times n} \\ \hline & b = A(x^{\sharp}) \end{array} \xrightarrow{(A, b)} \\ \begin{array}{c} \text{Opt. alg. for } F \\ \hline & \tilde{x} \end{array} \end{array}$$

Theorem (Structural)

F is μ -sharp in the ℓ_1 norm with $\mu \asymp 1$

$$F(x) - F(x^{\sharp}) \ge \mu \left\| x - x^{\sharp} \right\|_{1}, \qquad \forall x$$

and *L*-Lipschitz in the ℓ_1 norm with $L \simeq \sqrt{k}$

$$|F(x) - F(y)| \le L ||x - y||_1, \quad \forall x, y.$$

• Rearrange proof that x^{\sharp} optimizes (Constrained) with larger RIP constant

Ding and Wang

Robustness of recovery procedure

$$\xrightarrow{x^{\sharp}} \begin{array}{c} A \in \mathbb{R}^{m \times n} \\ \hline \tilde{b} = A(x^{\sharp}) + \delta \end{array} \xrightarrow{(A, \tilde{b})} \begin{array}{c} \text{Opt. alg. for } \tilde{F} \\ \hline \tilde{F} \end{array} \xrightarrow{\tilde{x}} \end{array}$$

Corollary (Robustness)

Let \tilde{x} be an ϵ minimizer of \tilde{F} .

- (to small noise) \tilde{x} satisfies $\|\tilde{x} x^{\sharp}\|_{1} \lesssim \|\delta\|_{1} + \epsilon$
- (to sparse noise) If $\frac{|\operatorname{supp}(\delta)|}{m} \lesssim 1/\sqrt{k}$, then $\|\tilde{x} x^{\sharp}\|_1 \lesssim \epsilon$

Corollary (Algorithms)

Restarted mirror descent (RMD) algorithm produces an ϵ -optimal solution to F in $O\left(k \log(n) \log(\epsilon^{-1})\right)$

iterations of the mirror descent update.

• Suppose we run mirror descent from x_0 for t iterations with step size η and mirror map

$$h(x) \approx \frac{1}{2} \|x - x_0\|_1^2$$

Related: Polyak [1969], Roulet et al. [2015], Roulet and d'Aspremont [2017], Yang and Lin [2018], Renegar and Grimmer [2022]

• Suppose we run mirror descent from x_0 for t iterations with step size η and mirror map

$$h(x) \approx \frac{1}{2} \|x - x_0\|_1^2$$

• Mirror descent guarantee: output y

$$F(y) - F(x^{\sharp}) \le \frac{L^2 \eta \ln n}{2} + \frac{D_h(x^{\sharp} || x_0)}{2\eta t} \approx \frac{L^2 \eta \ln n}{2} + \frac{\left\| x^{\sharp} - x_0 \right\|_1^2}{4\eta t}$$

Related: Polyak [1969], Roulet et al. [2015], Roulet and d'Aspremont [2017], Yang and Lin [2018], Renegar and Grimmer [2022]

• Suppose we run mirror descent from x_0 for t iterations with step size η and mirror map

$$h(x) \approx \frac{1}{2} \|x - x_0\|_1^2$$

Mirror descent guarantee: output y

$$F(y) - F(x^{\sharp}) \le \frac{L^2 \eta \ln n}{2} + \frac{D_h(x^{\sharp} || x_0)}{2\eta t} \approx \frac{L^2 \eta \ln n}{2} + \frac{\left\| x^{\sharp} - x_0 \right\|_1^2}{4\eta t}$$

• Optimizing in η and applying sharpness \longrightarrow

$$F(y) - F(x^{\sharp}) \le \frac{1}{2} \left(F(x_0) - F(x^{\sharp}) \right)$$

after $\asymp \frac{L^2}{\mu^2} \ln n$ iterations
